Getting More From Your Mac

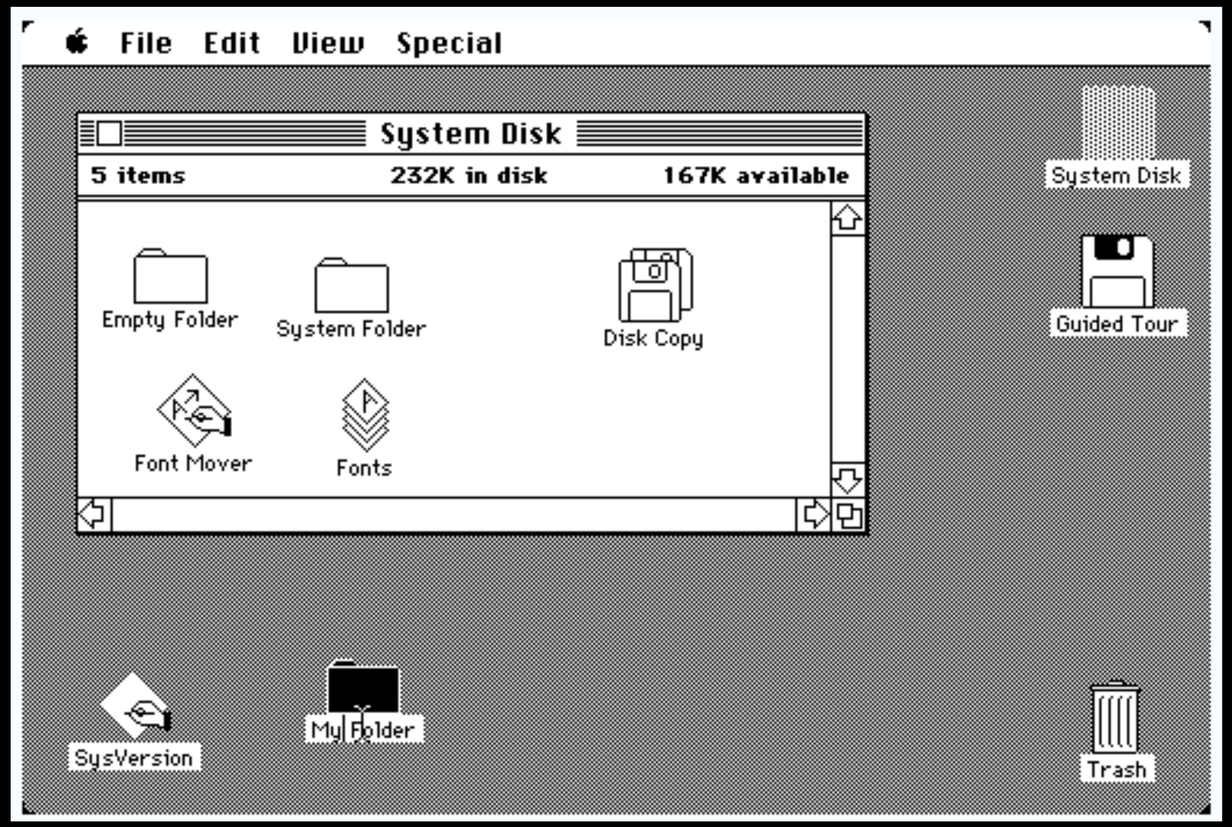
History

R. Scott Granneman & Jans Carton

The Mac popularized the *GUI* (Graphical User Interface)

1984–2001: “Classic” Mac OS 1-9

2001–Present: ~~Mac OS X~~ ~~OS X~~ macOS



1984: The original Macintosh operating system, with an elegant & advanced GUI, but technically limited in many ways

A current macOS app icon is 1024×1024 px

That’s huge compared to the original Macintosh screen, which was 512×312 px!

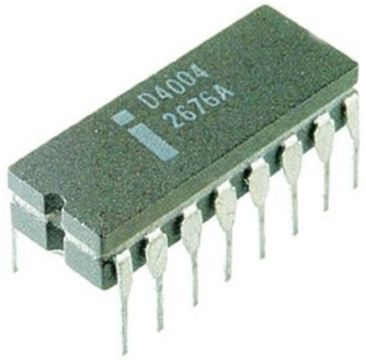
Apple's CPU History

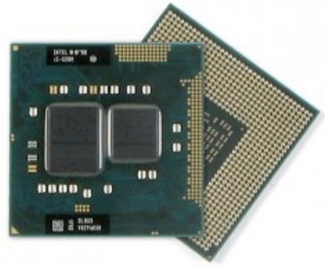
CPU: *Central Processing Unit*

The computer's brains

Interprets instruction & processes data

Consists of millions of integrated circuits, or *transistors*, on a small chip

CPU	Intel 4004	Intel Core i7
Year	1970	2013
Transistors	2250	1.48 billion
Speed	740 kHz	3.5 GHz
		




Manufacturing Process

1 meter = 39.37 inches = 1 yard + 3.37 inches

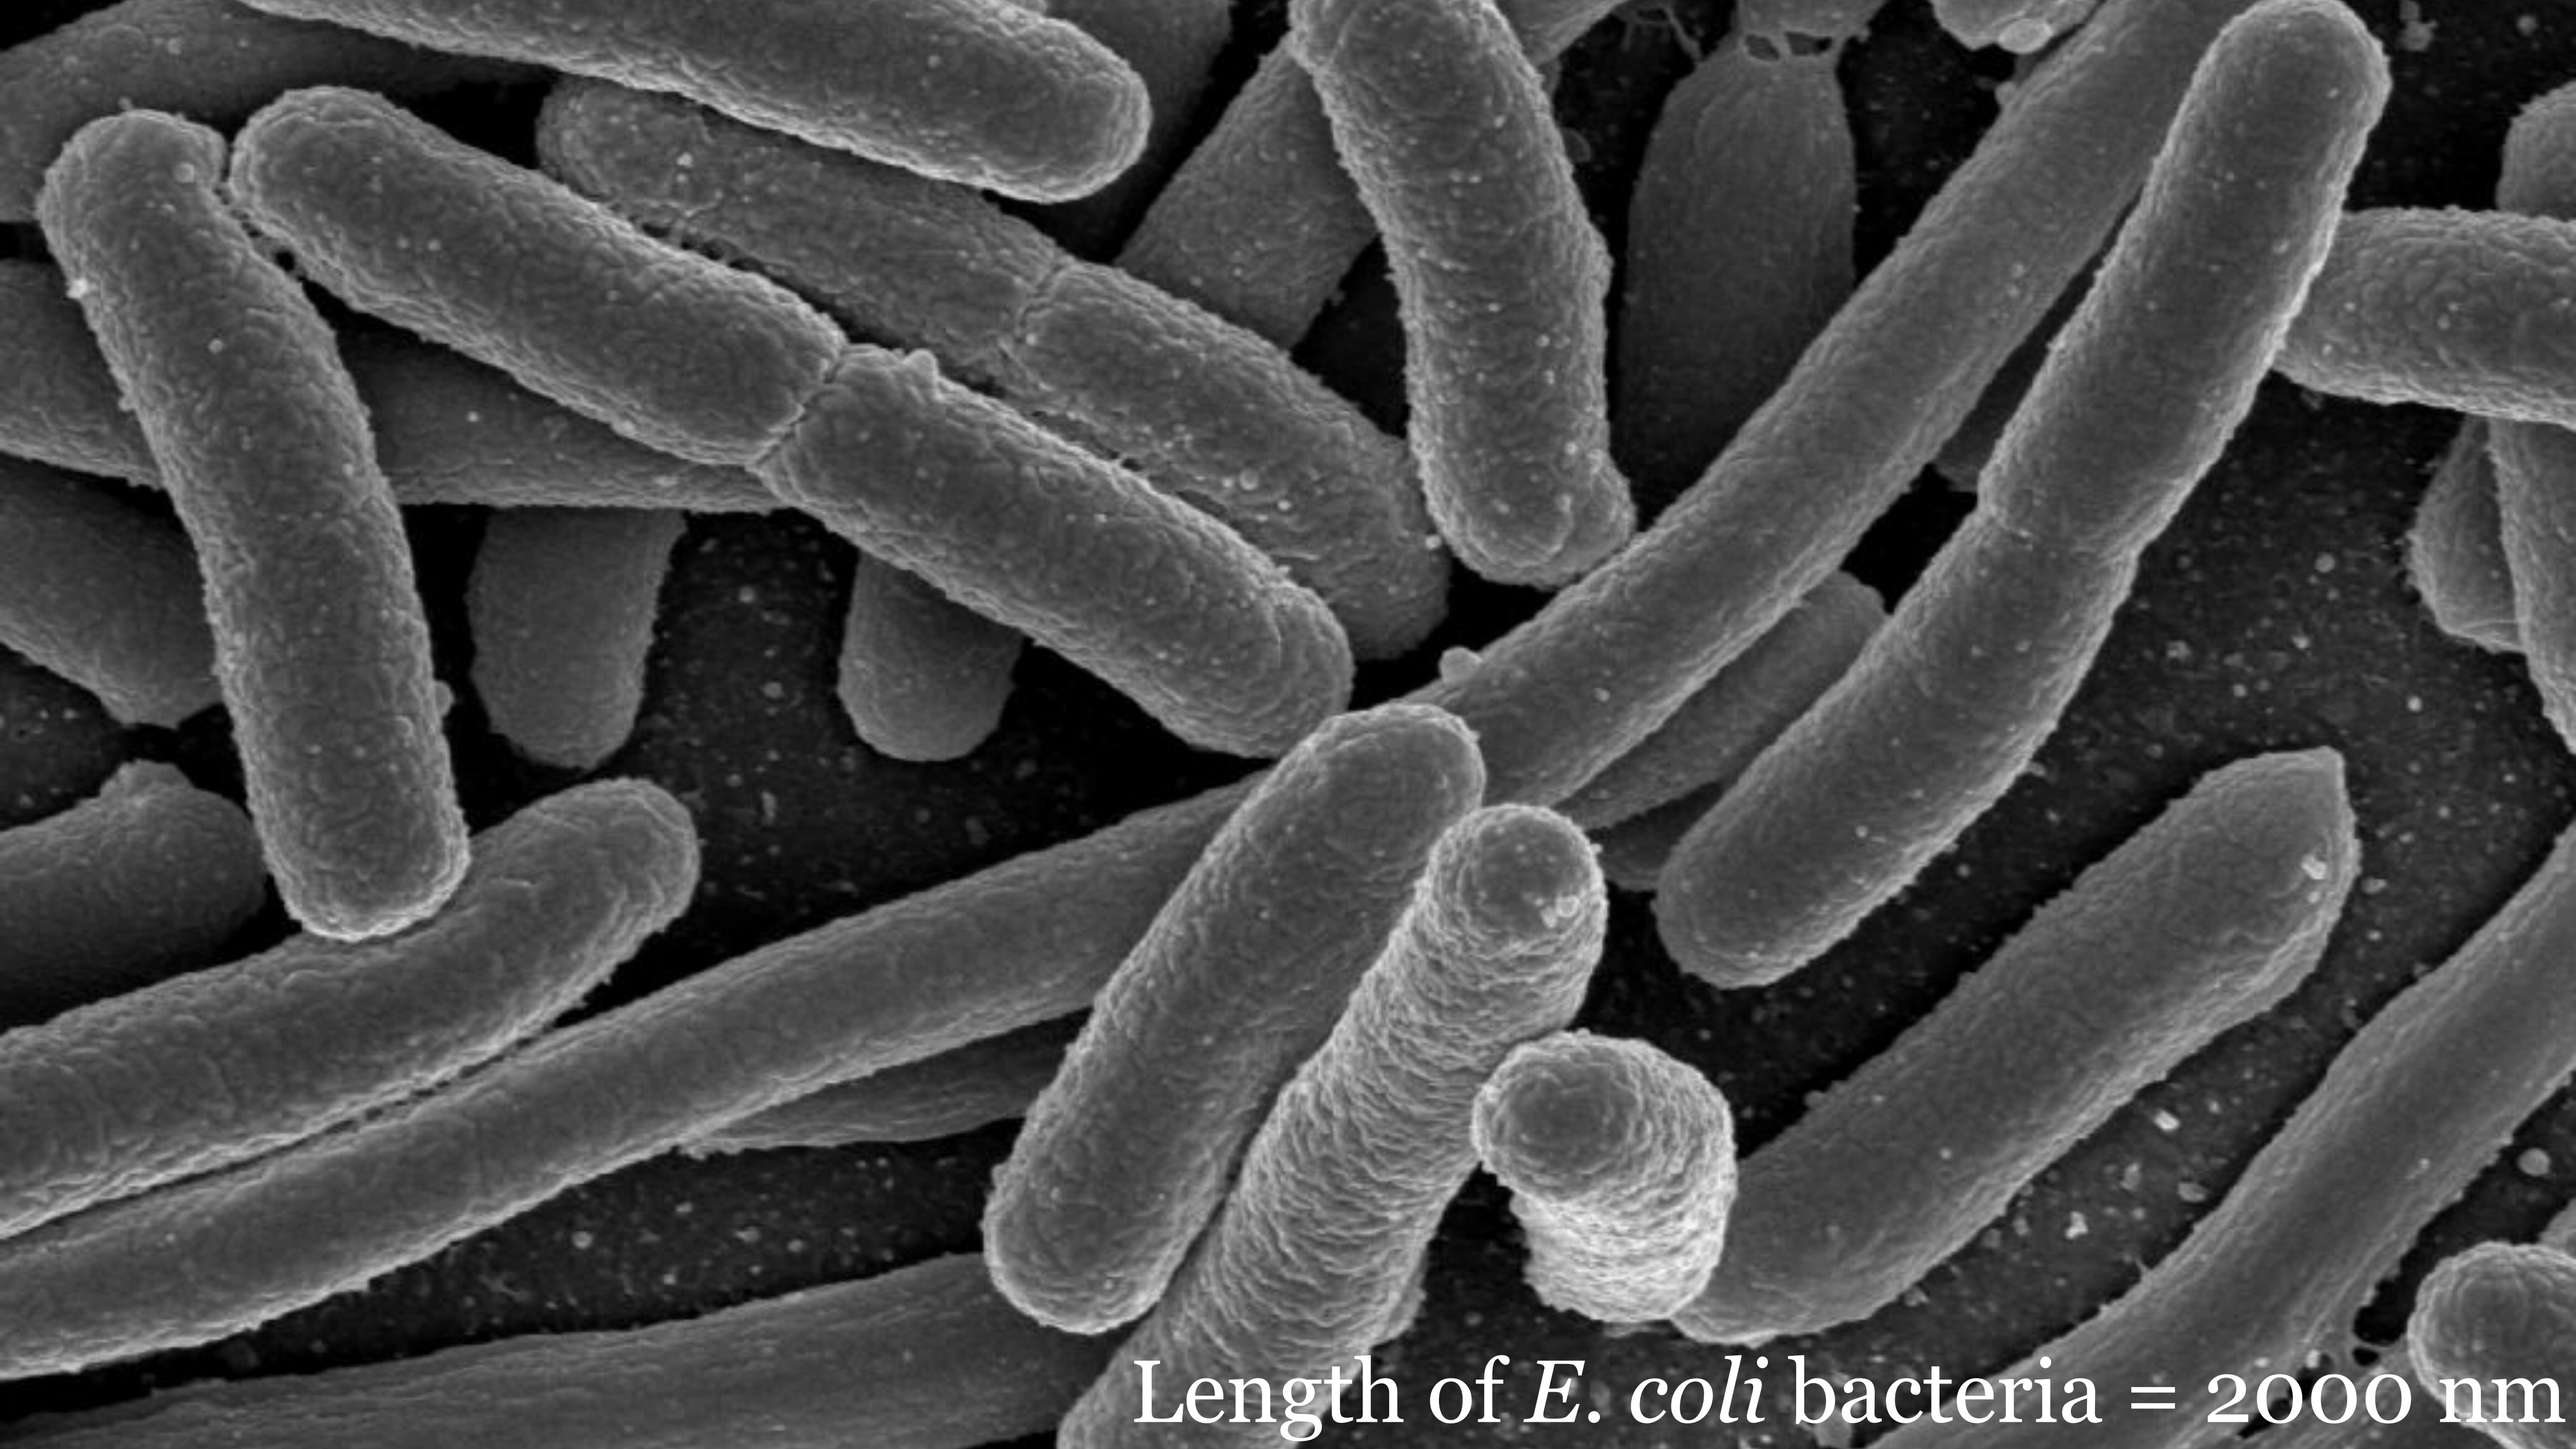
1 meter = 100 cm = 1,000,000,000 nm (*nanometers*)

1 nanometer = 1 billionth of a meter (1×10^{-9} m)

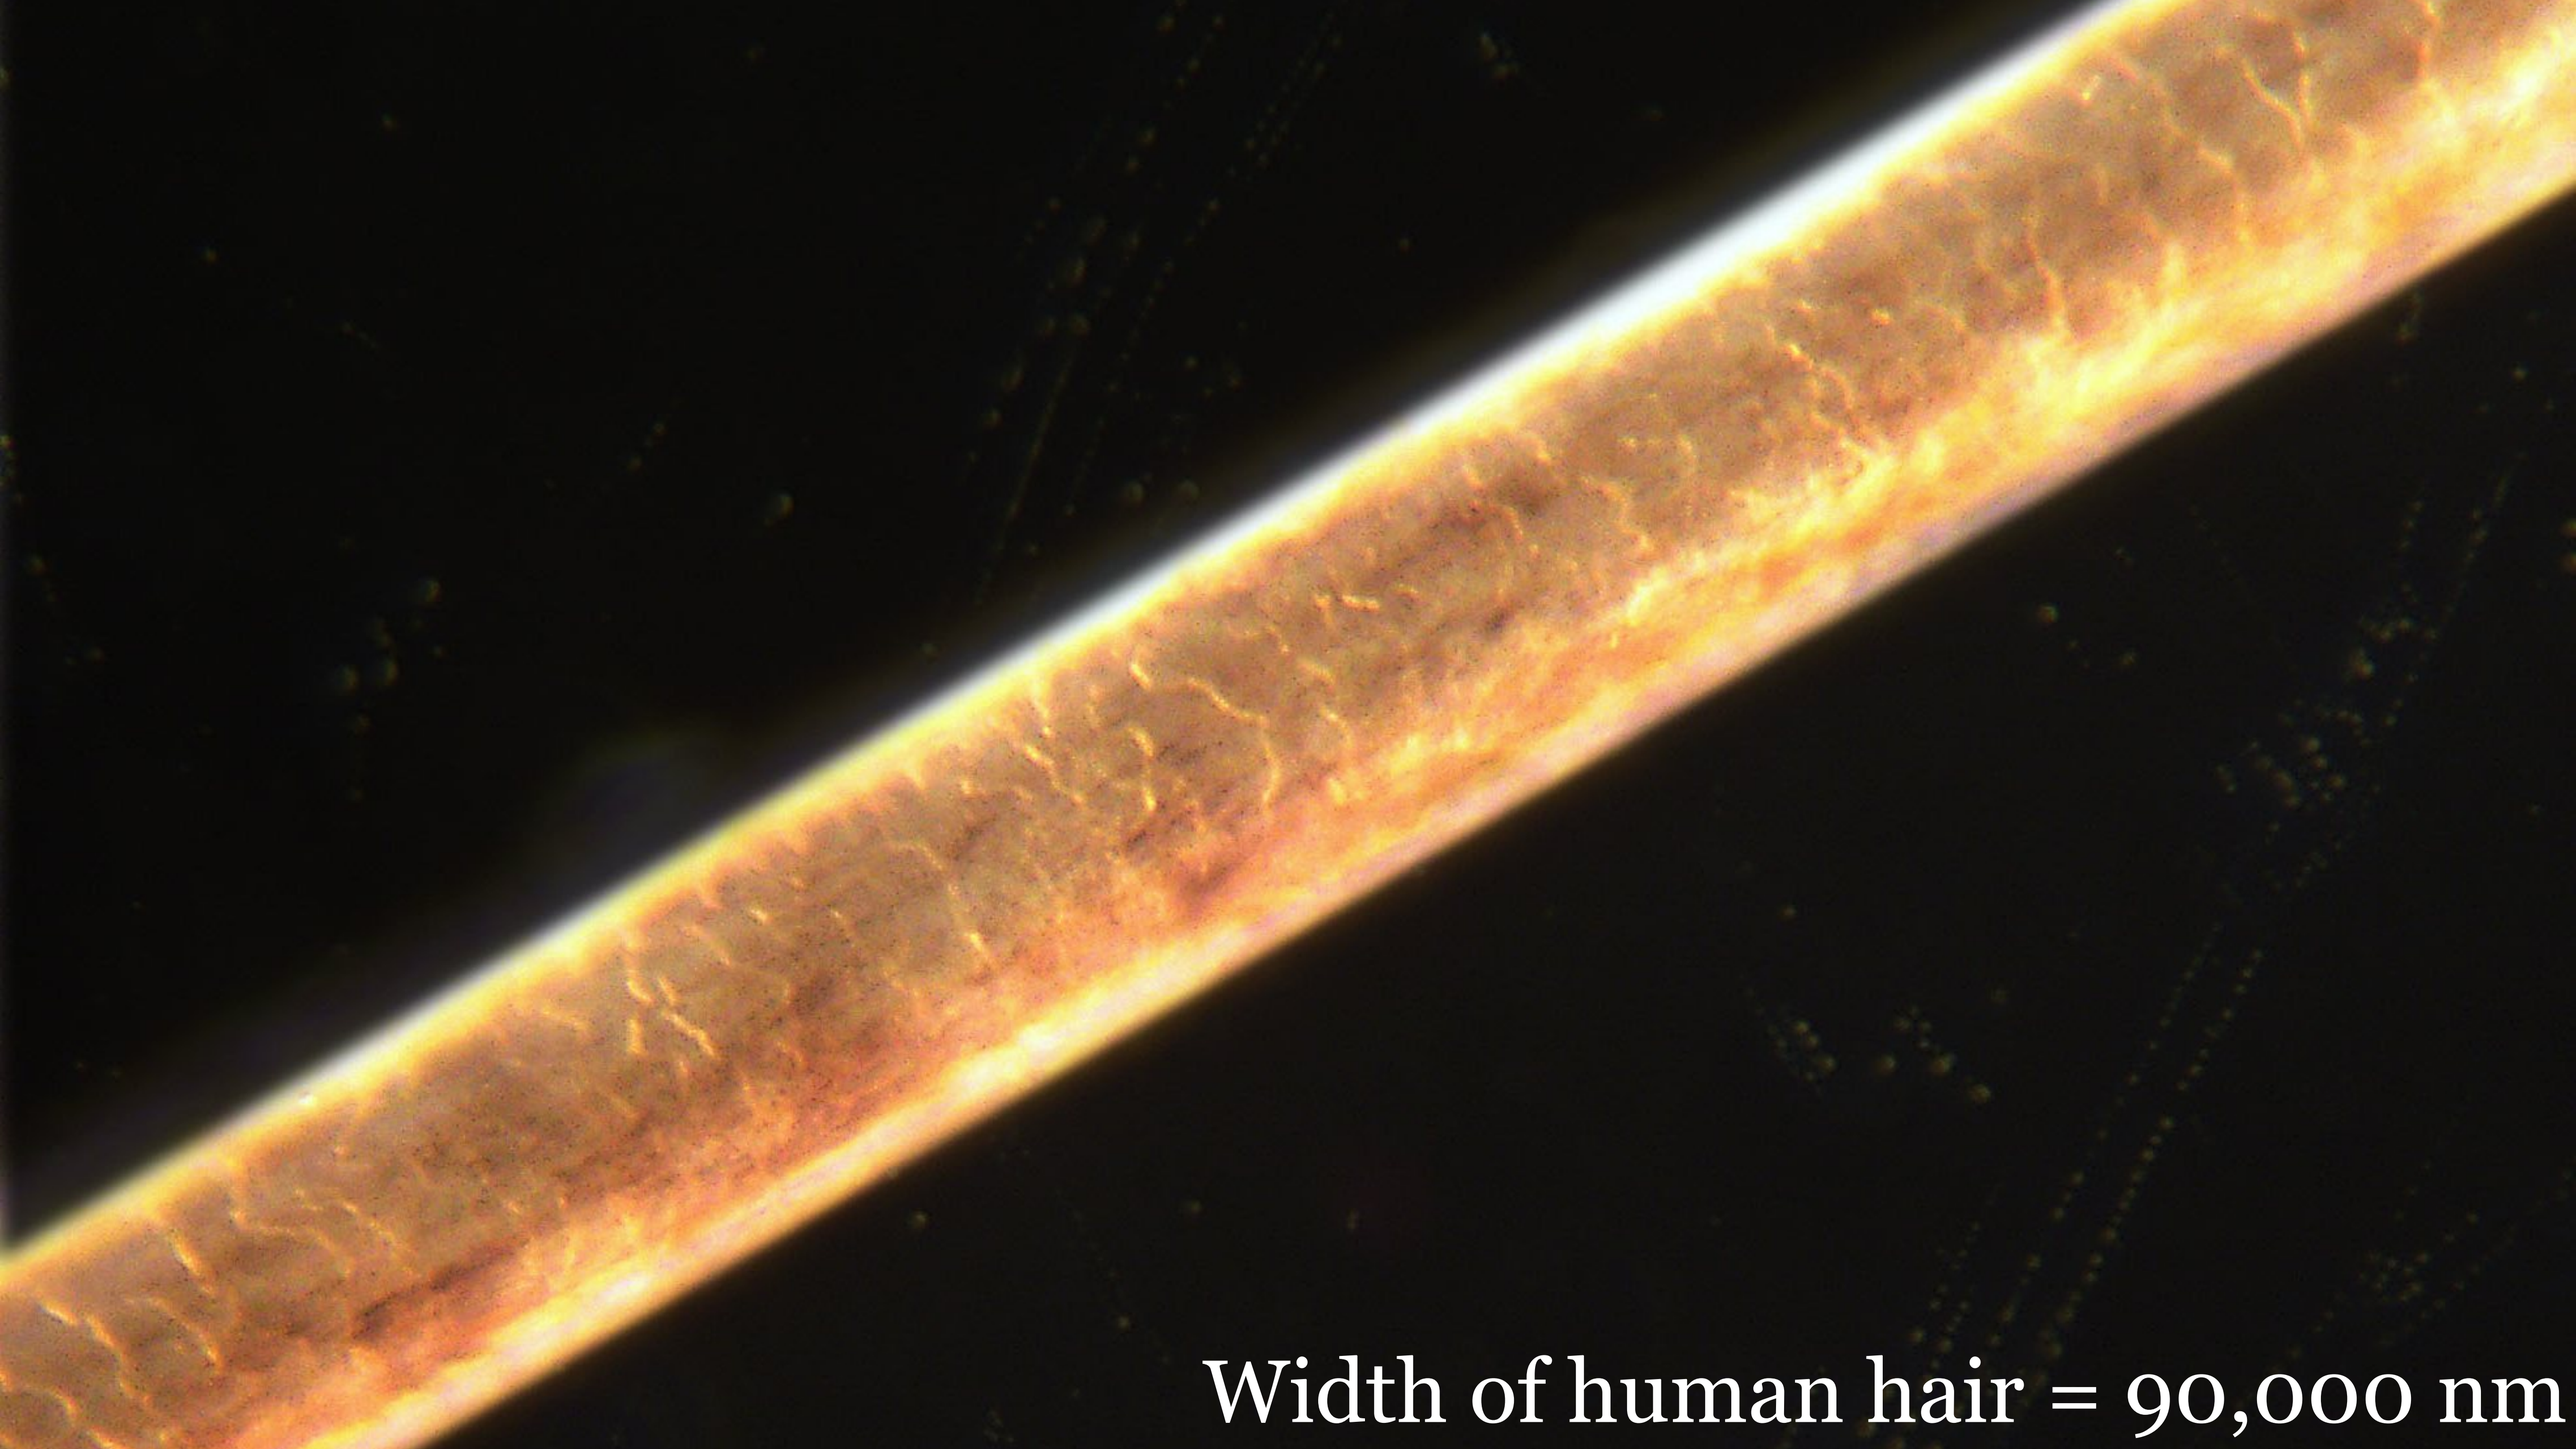
How big is that?

1 water molecule = <1 nm

1918 influenza virus = ~120 nm



Length of *E. coli* bacteria = 2000 nm



Width of human hair = 90,000 nm

CAVALIERS
XL
NBA
2,160,000,000 nm

1994: 600 nm

1995: 350 nm

1998: 250 nm

1999: 180 nm

2000: 130 nm

2002: 90 nm

2006: 65 nm

2008: 45 nm

2010: 32 nm

2012: 22 nm

2014: 14 nm

2016: 10 nm

2018: 7 nm

2020: 5 nm

CPU manufacturing processes over time

32 nm of what?

The technical explanation: “The expected half-pitch of a memory cell”

The non-technical explanation: *the distance between transistors*

Currently, CPUs are using 32 nm & 22 nm processes

.

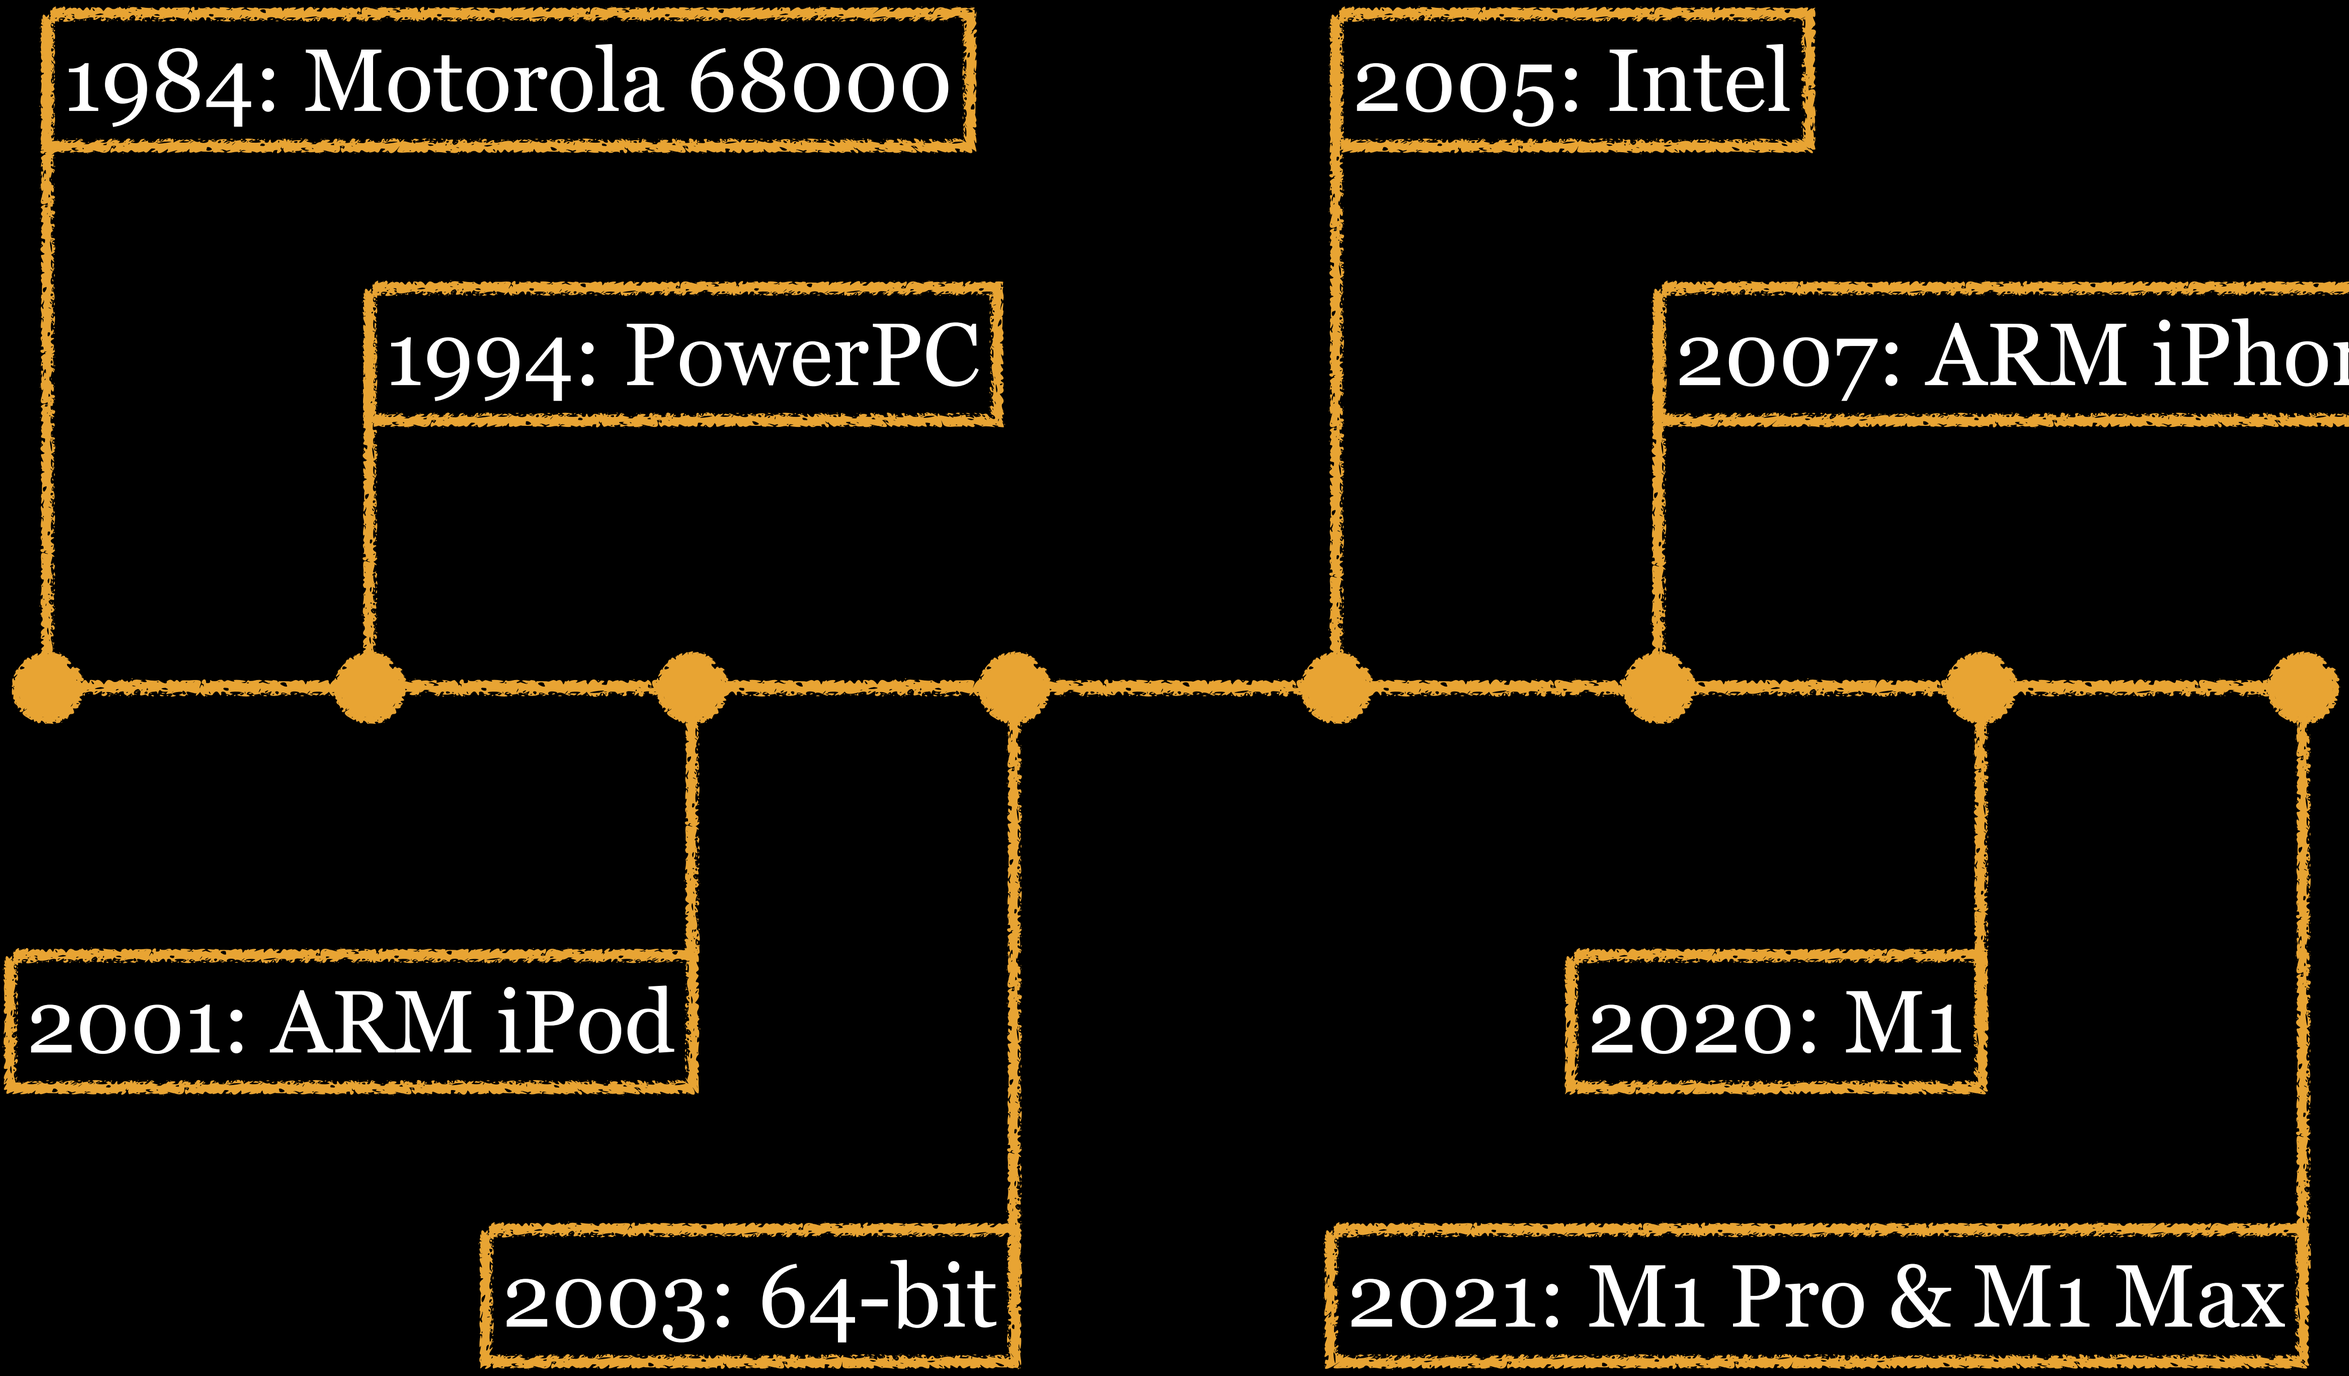
4 million 32 nm transistors can fit in a period

6 million 22 nm transistors can fit in a period

A 22 nm transistor can switch on & off well over 100 billion times per second

As manufacturing process decreases, the CPU…

» can pack in more more transistors
» is faster
» is more power efficient



1984: Motorola 68000
1994: PowerPC
2001: ARM iPod
2003: 64-bit
2005: Intel
2007: ARM iPhone
2020: M1
2021: M1 Pro & M1 Max

PowerPC

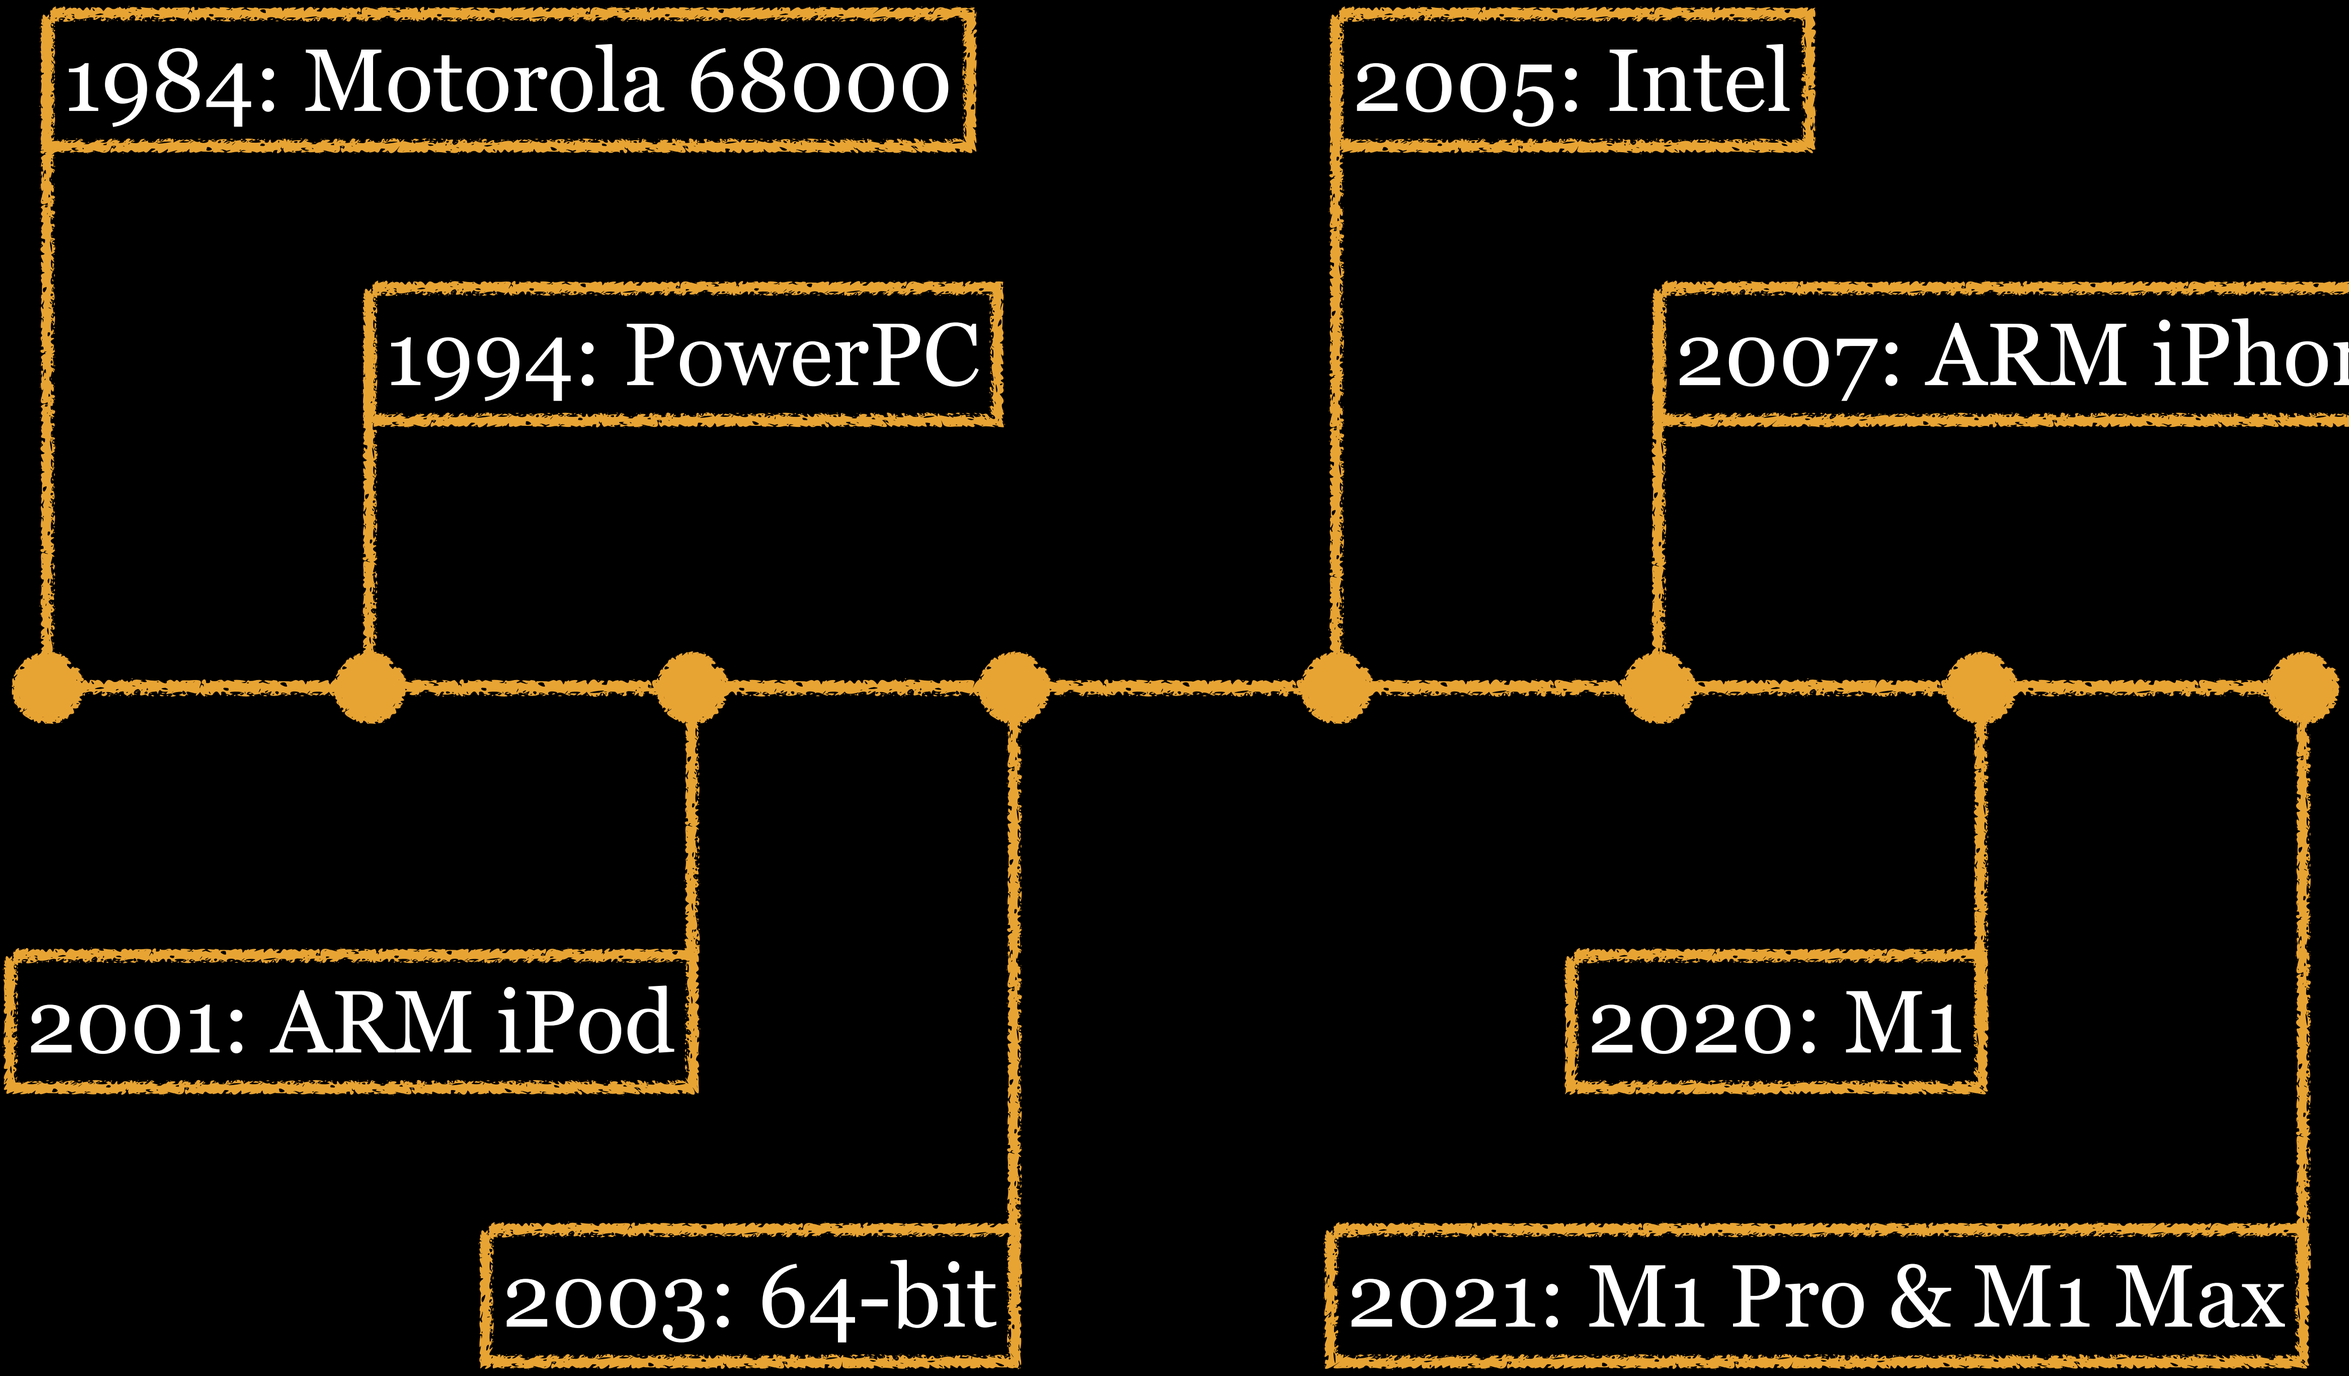
Created by 1991 as an Apple-IBM-Motorola alliance

Tried to counter *WinTel* (Windows + Intel) powerhouse

Used in desktops & laptops, but popular in servers & embedded computers (Microsoft Xbox 360, Ford cars, HP printers)

Most notable success: used in Apple Macs 1994-2006

Now a consortium led by IBM & Freescale Semiconductor (formerly Motorola)



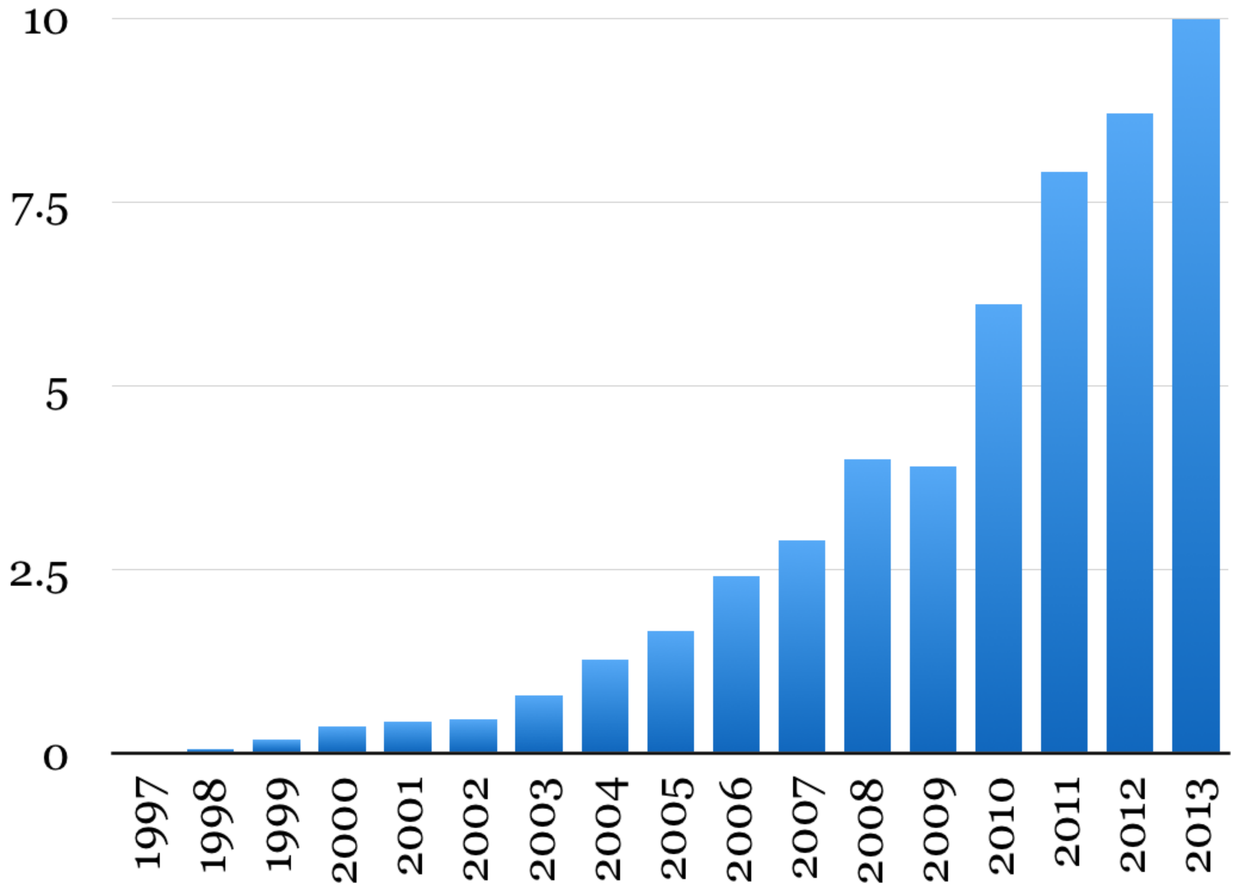
1984: Motorola 68000
1994: PowerPC
2001: ARM iPod
2003: 64-bit
2005: Intel
2007: ARM iPhone
2020: M1
2021: M1 Pro & M1 Max

ARM

ARM Holdings

Located in Cambridge, UK

Focuses on low-power, mobile-friendly CPUs for mobile phones, iPad & iPod, Nintendo Game Boy Advance & DS, GPS devices, digital cameras, digital TVs, network devices, & much more



ARM chips manufactured per year, in billions (50 billion total)

75% of all 32-bit embedded CPUs

95% of smartphones

10% of mobile computers

35% of digital TVs & set-top boxes

0% of desktops, laptops, & servers in 2010 → now a tiny but growing %

ARM licenses its technology to other companies, rather than manufacturing CPUs itself (like Intel & AMD do)

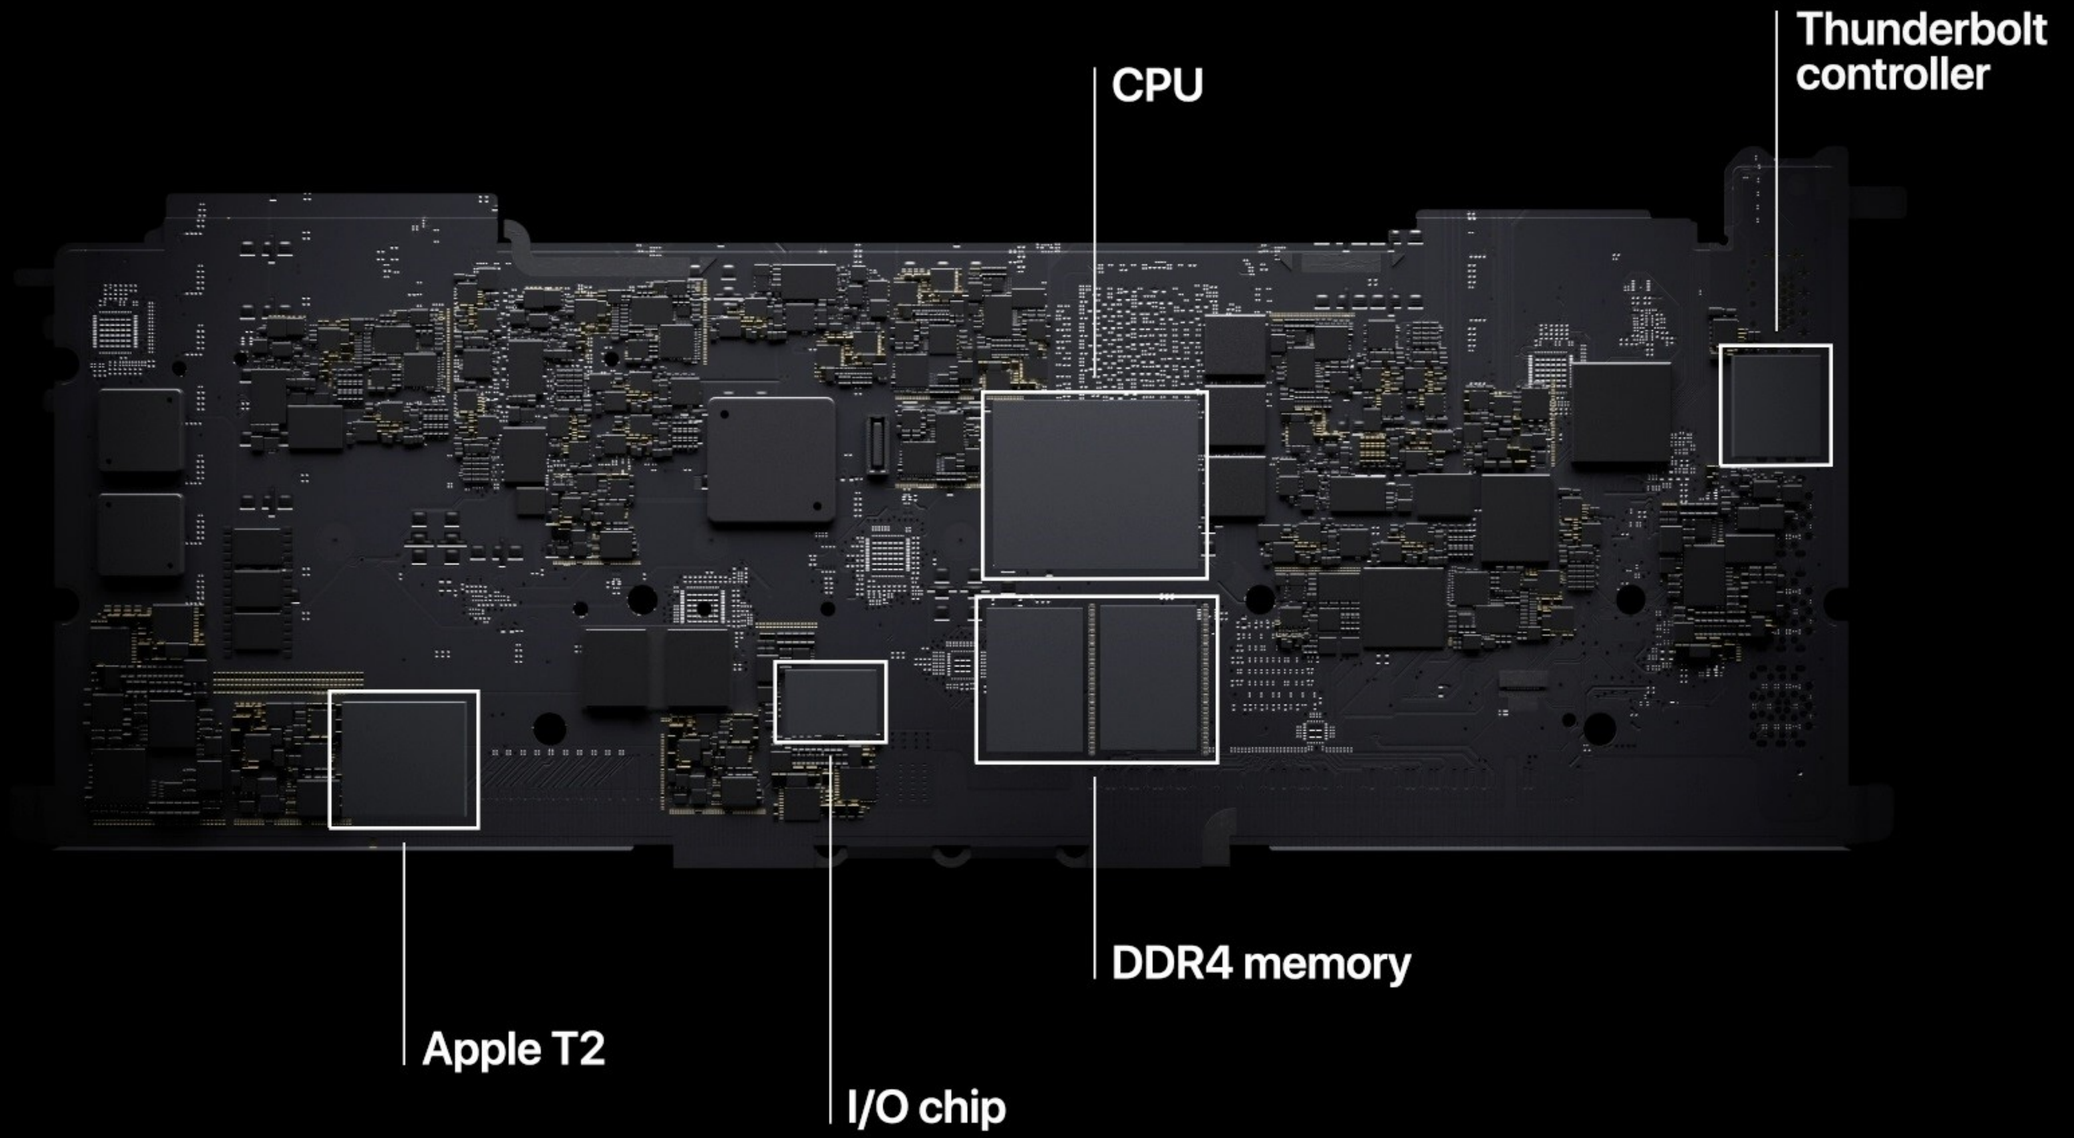
Apple: “The transition to Apple silicon will take about two years to complete”



Thunderbolt controller
CPU
DDR4 memory
Apple T2
I/O chip

Why the movement towards SoCs?

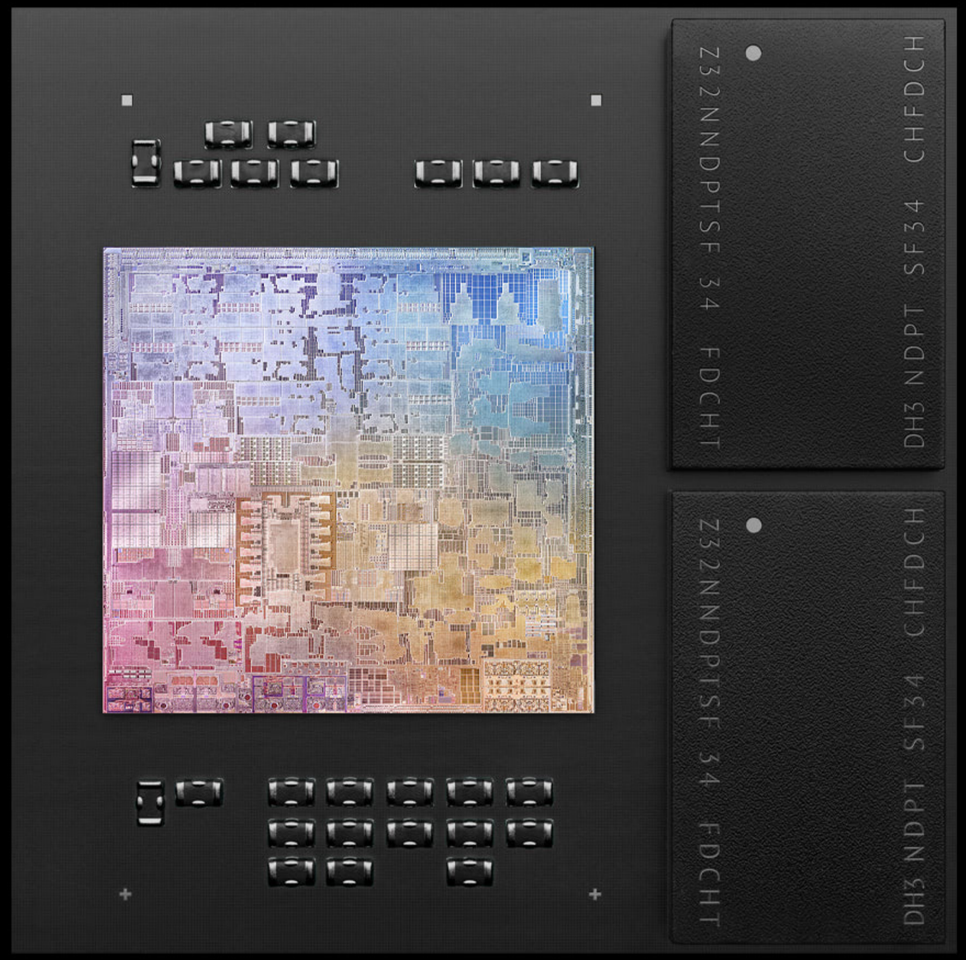
Needed for smartphones: saves space, ↓ power, & ↑ batteries

Expertise developed from mobile can be applied to desktops & laptops as well

“A system on a chip (SoC; es-oh-SEE or sock) is an integrated circuit (also known as a ‘chip’) that integrates all or most components of a computer or other electronic system. These components almost always include a central processing unit (CPU), memory, input/output ports and secondary storage, often alongside other components such as radio modems and a graphics processing unit (GPU) — all on a single substrate or microchip.” —Wikipedia

“It features the world’s fastest CPU core in low-power silicon, the world’s best CPU performance per watt, the world’s fastest integrated graphics in a personal computer…

…up to 3.5× faster CPU performance, up to 6× faster GPU performance, and up to 15× faster machine learning, all while enabling battery life up to 2× longer than previous-generation Macs” —Apple, November 10, 2020



1st PC chip built using 5-nanometer process technology

16 billion transistors

5 nanometer process

Machine learning accelerators

16-core Neural Engine

11 trillion operations per second

Thunderbolt / USB 4 controller

Media encode and decode engines

M1

16 billion transistors

Up to 8-core GPU

8-core CPU

Advanced image signal processor

Secure Enclave

Unified memory architecture

Industry-leading performance per watt

Advanced power management
High-efficiency CPU cores
High-performance CPU cores
Low-power video playback
Neural Engine
High-bandwidth caches
Advanced display engine
High-performance GPU
Advanced silicon packaging
Cryptography acceleration
Always-on processor
M1
High-performance video editing
High-performance unified memory
Performance controller
Machine learning accelerators
High-quality image signal processor
Low-power design
High-performance storage
High-efficiency audio processor
Secure Enclave

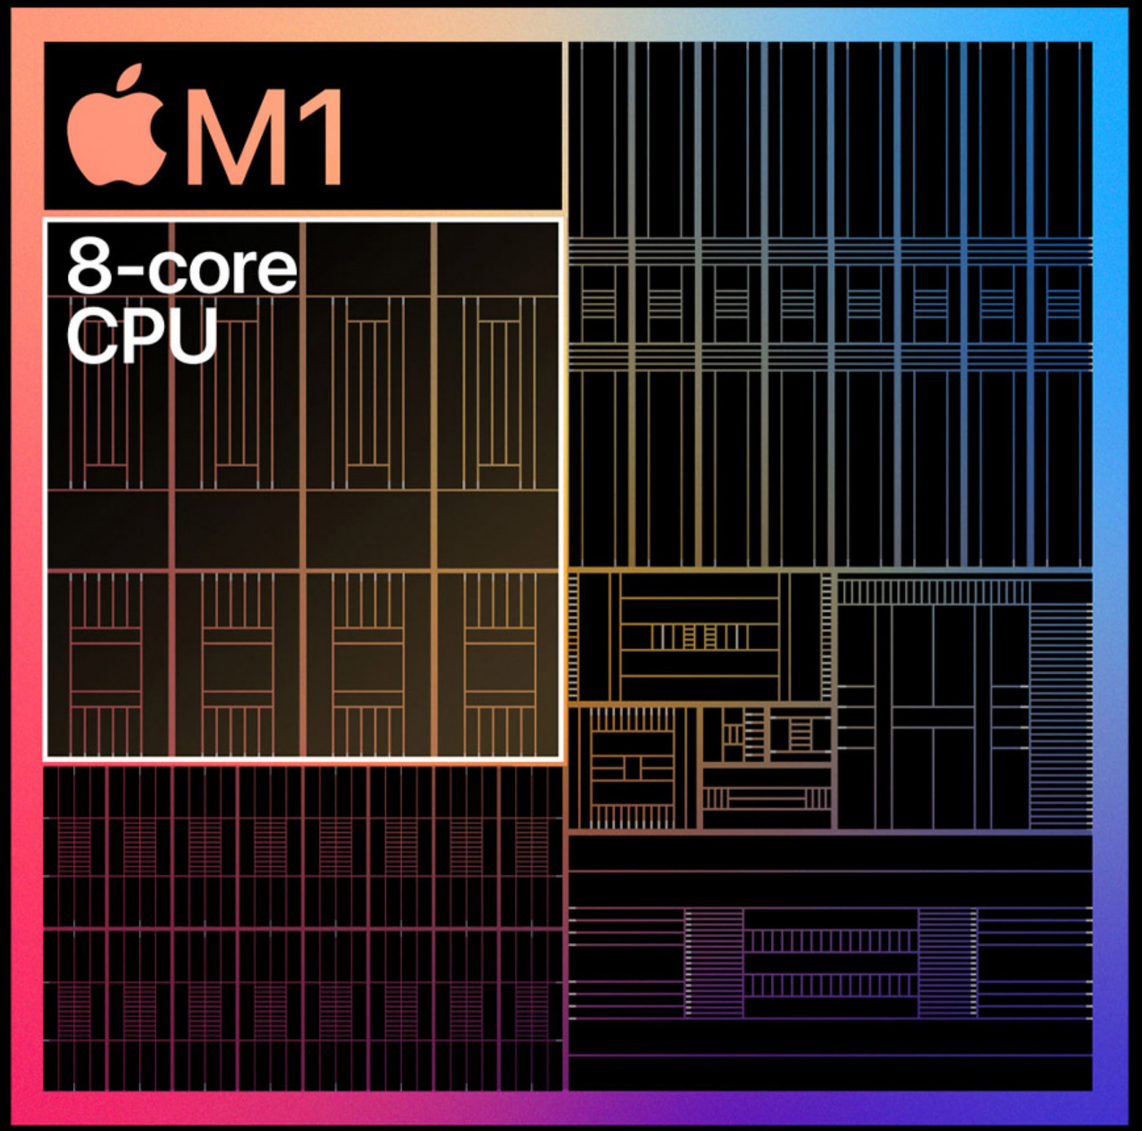
8-core CPU

The highest-performance CPU we've ever built.

Up to

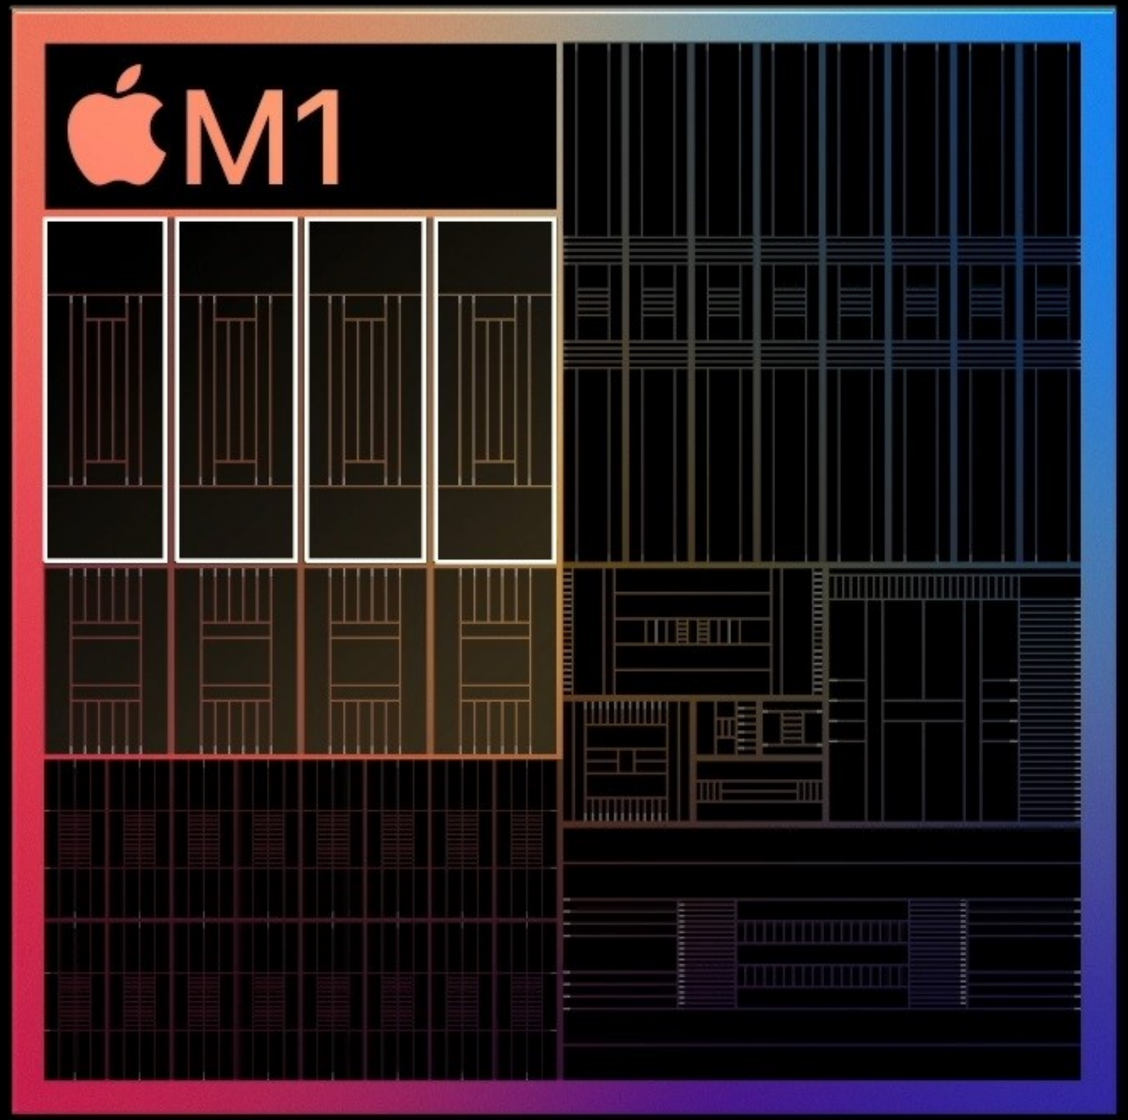
3.5x

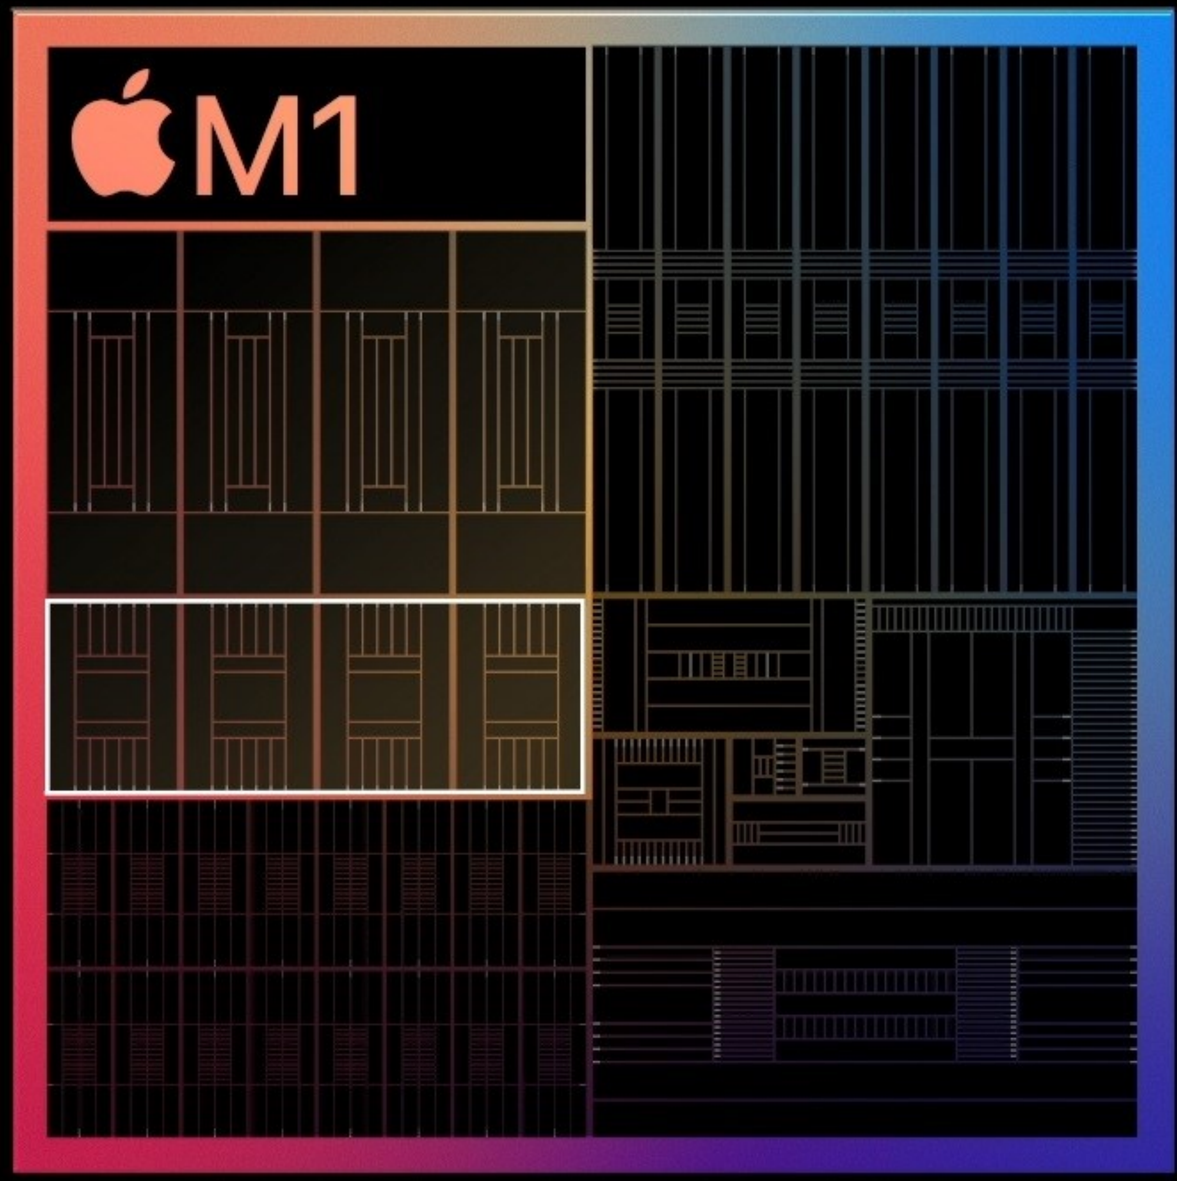
faster CPU performance[1]



4 high-performance cores

Ultra-wide execution architecture
192KB instruction cache
128KB data cache
Shared 12MB L2 cache





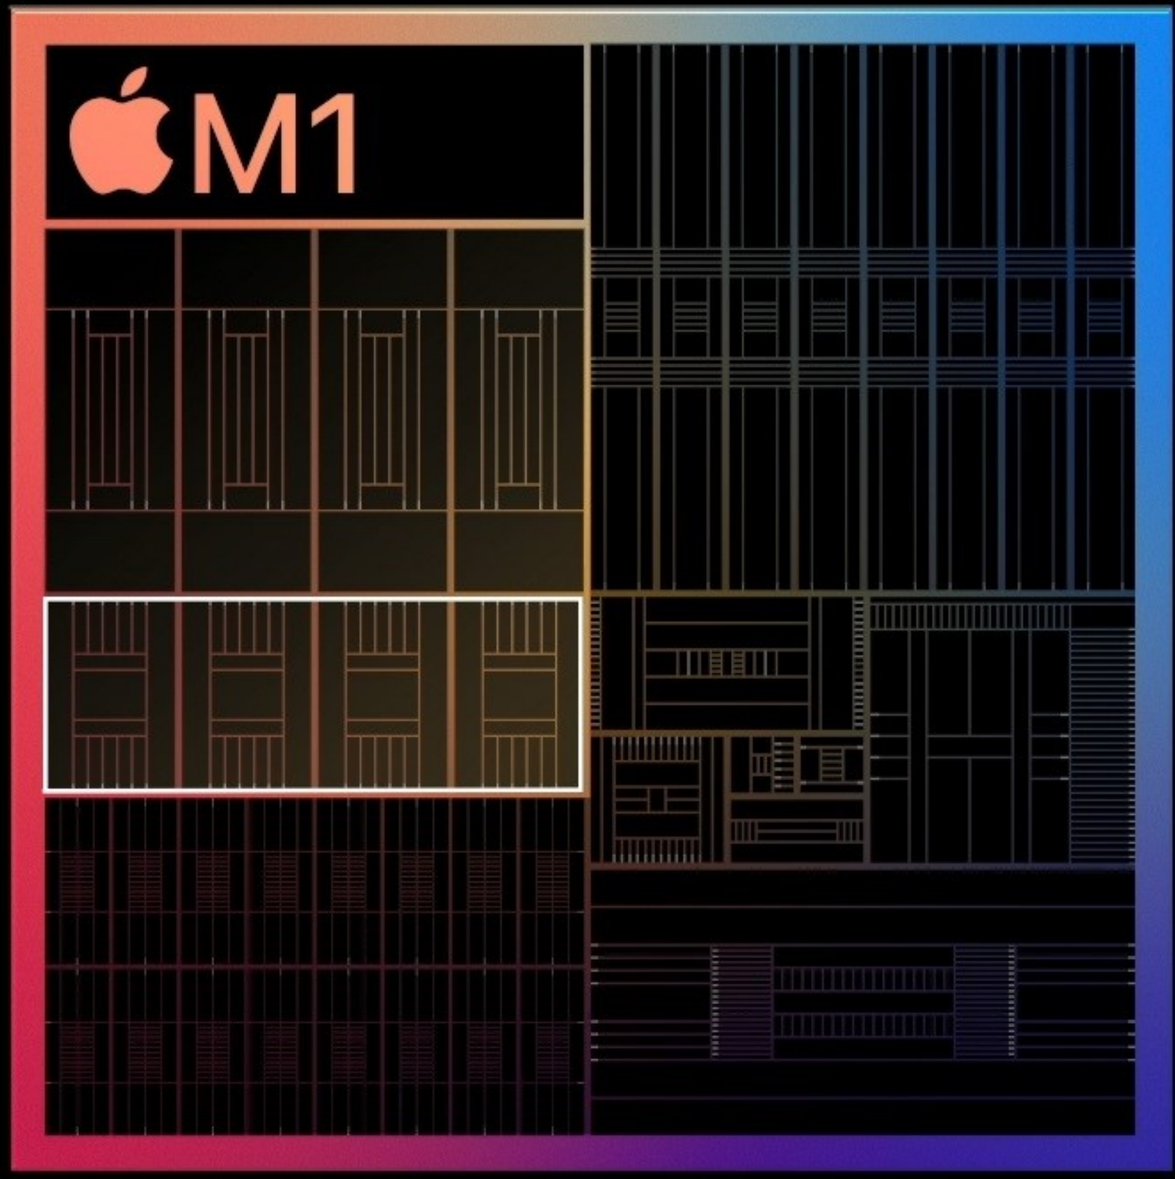
4 high-efficiency cores

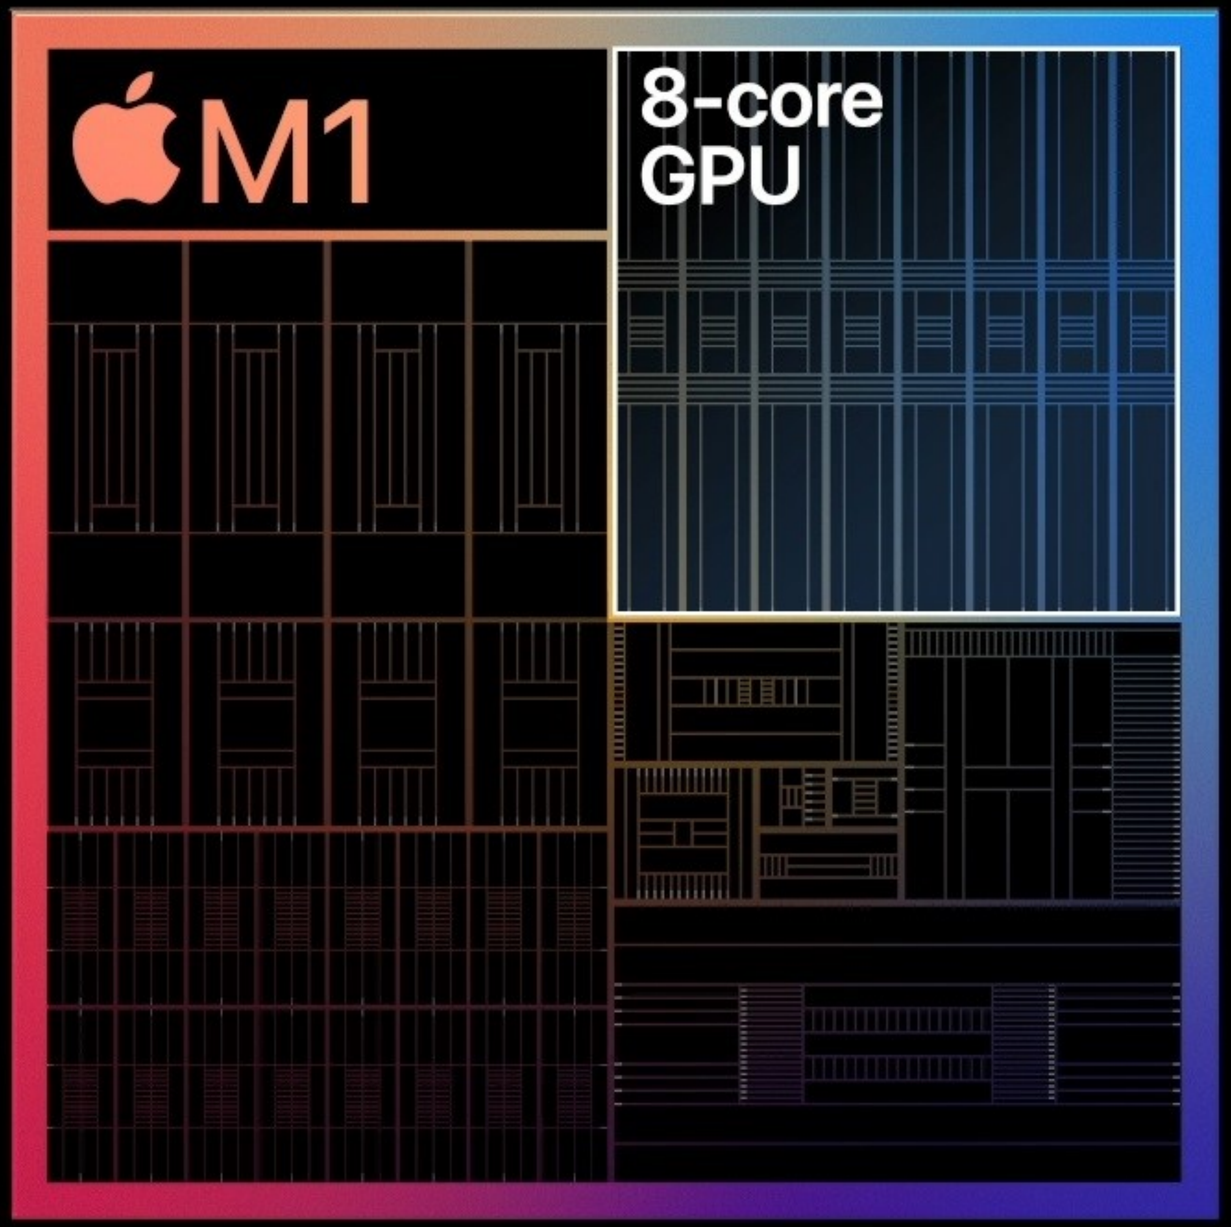
Wide execution architecture
128KB instruction cache
64KB data cache
Shared 4MB L2 cache

1/10th of power

For “lightweight, everyday tasks” like email or web browsing at 1/10th the power

Can work together with 4 high-performance cores





Up to 8 cores

128 execution units

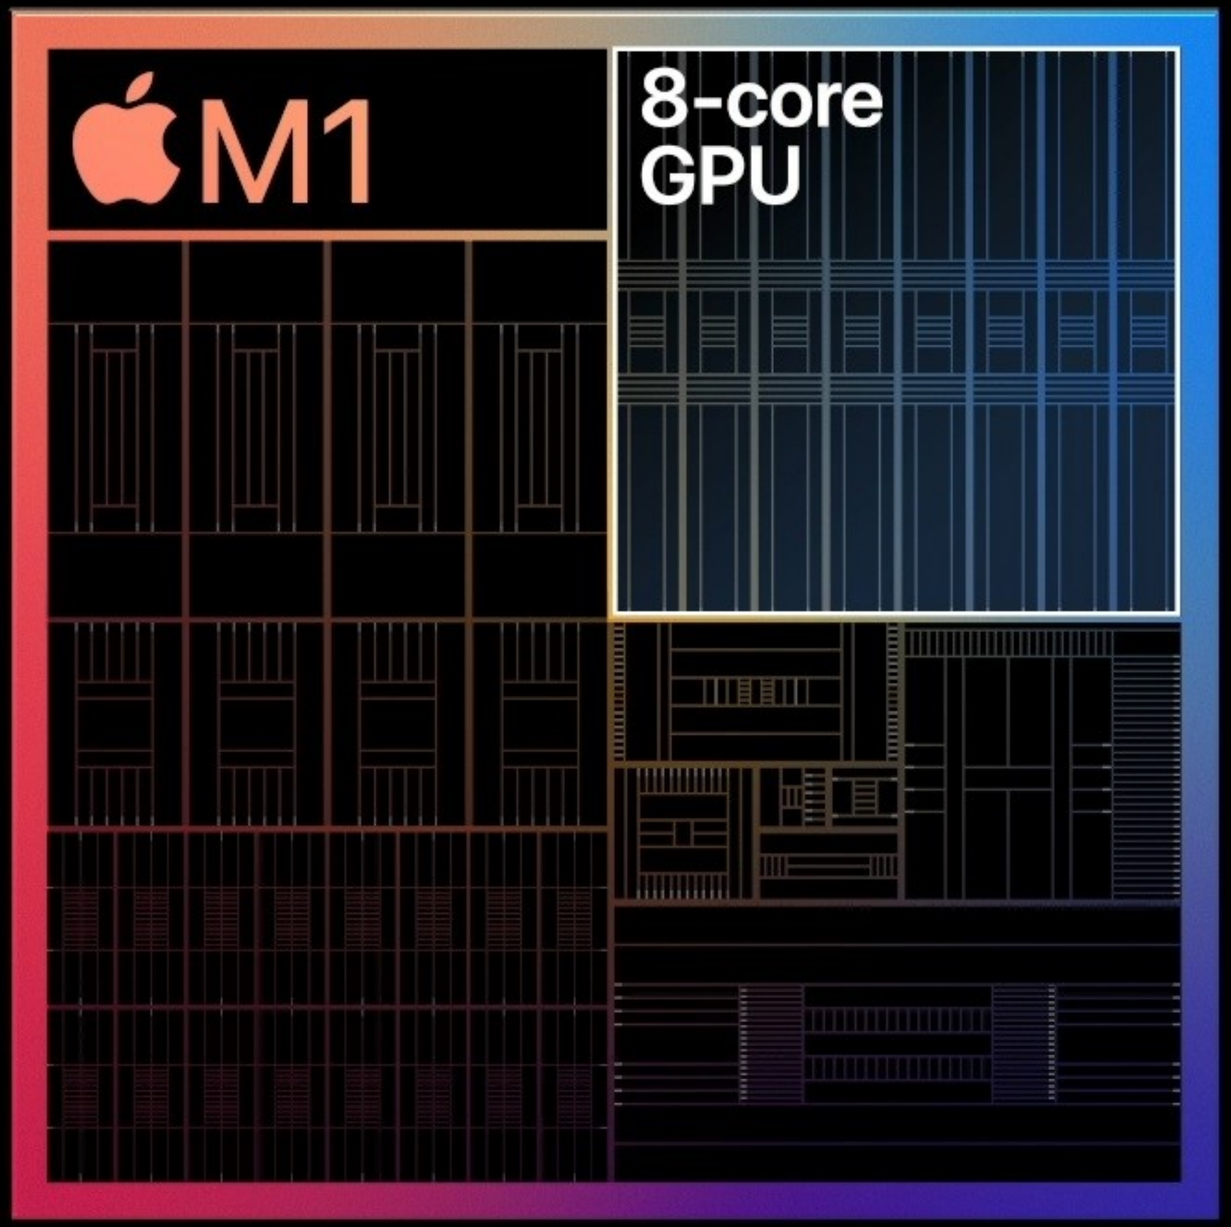
Up to 24,576 concurrent threads

2.6 teraflops

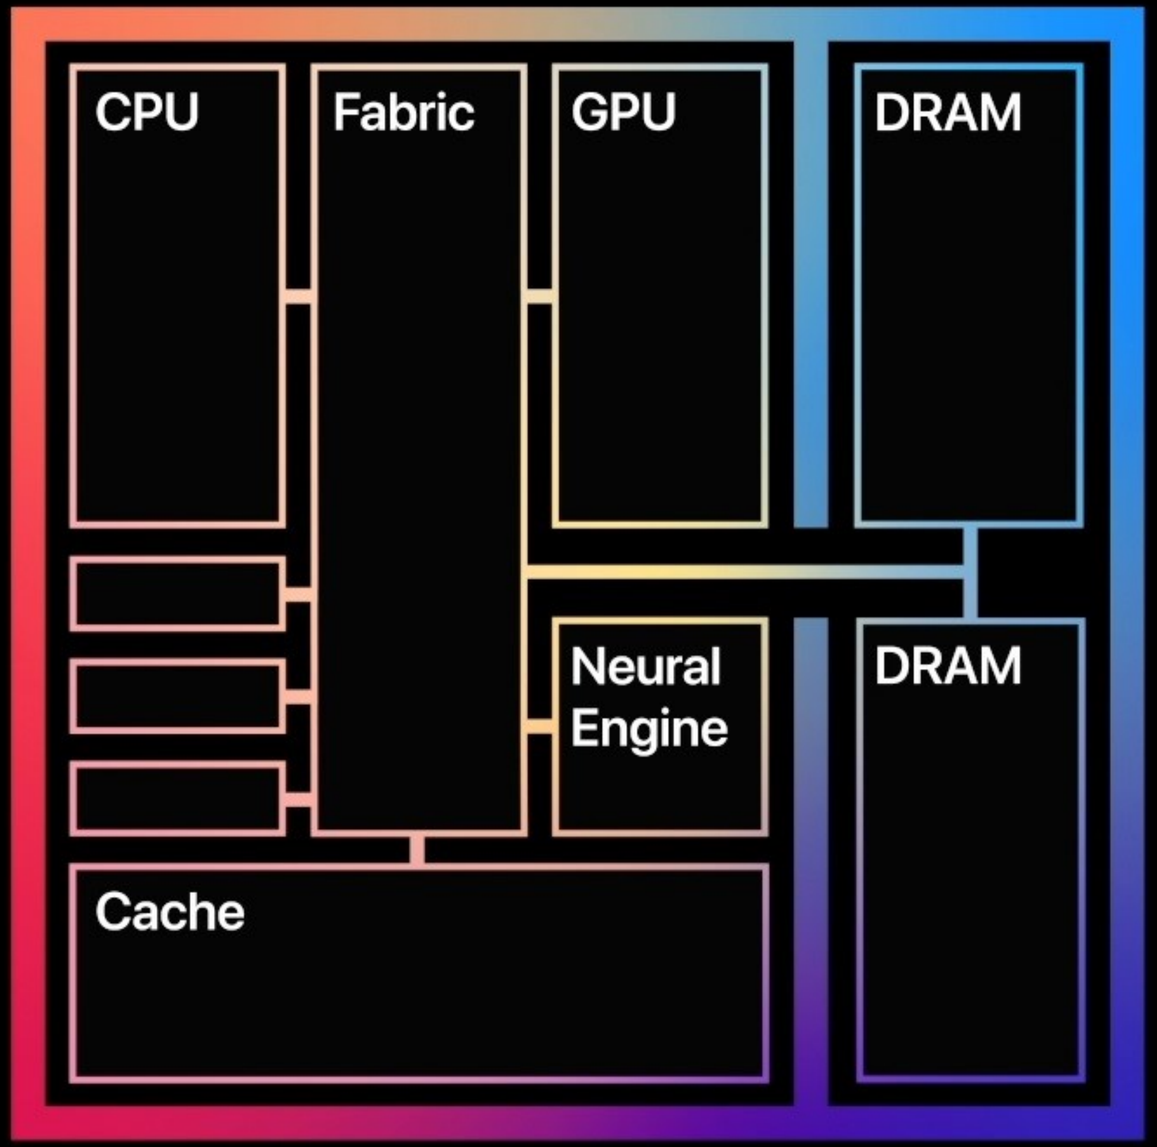
82 gigatexels/second

41 gigapixels/second

“World’s fastest integrated graphics in a personal computer”



Designed to “handle extremely demanding tasks with ease, from smooth playback of multiple 4K video streams to rendering complex 3D scenes”

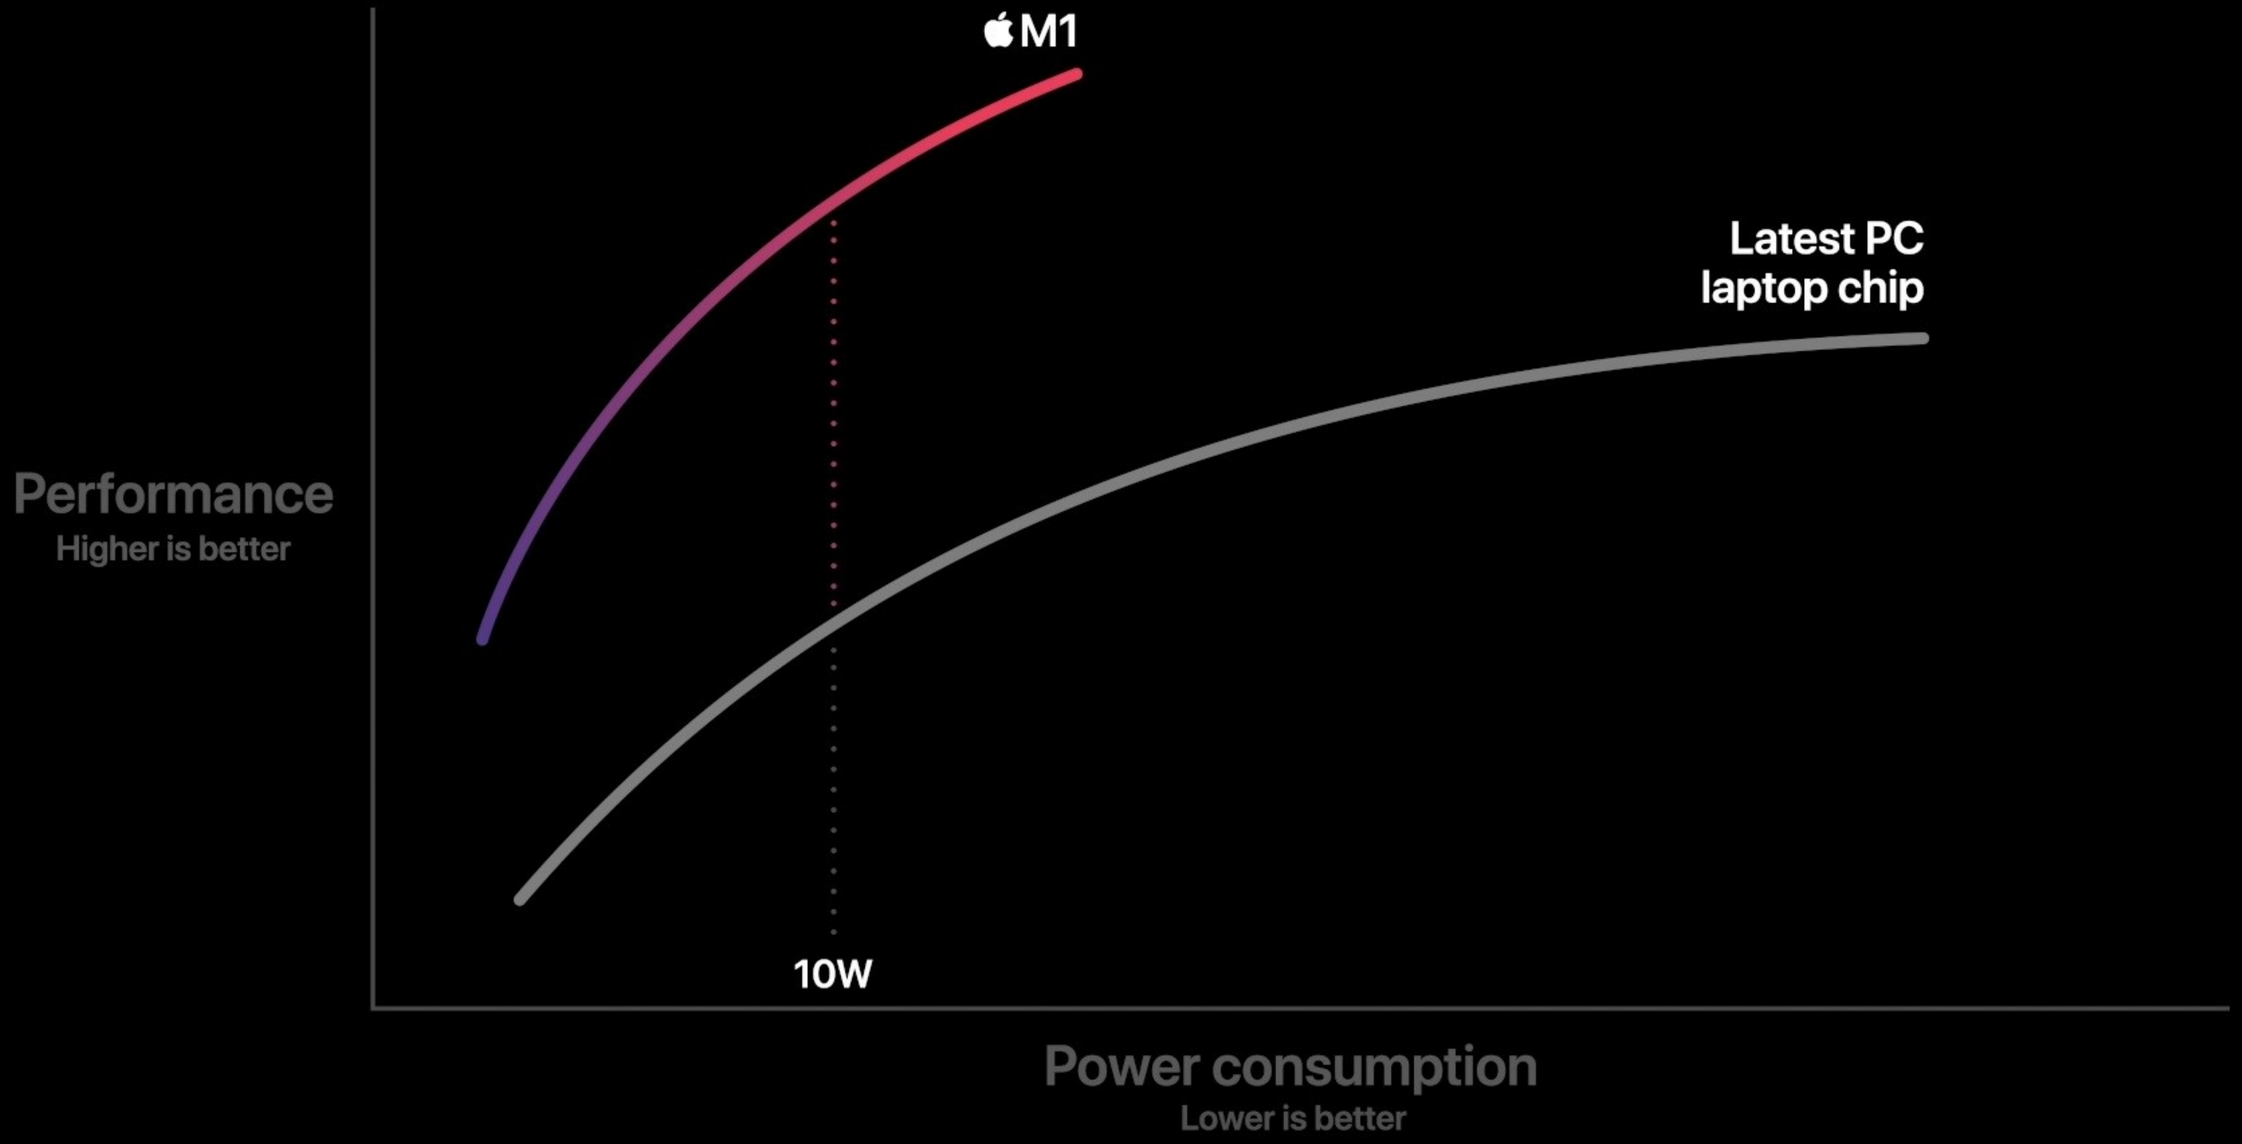


Unified memory architecture

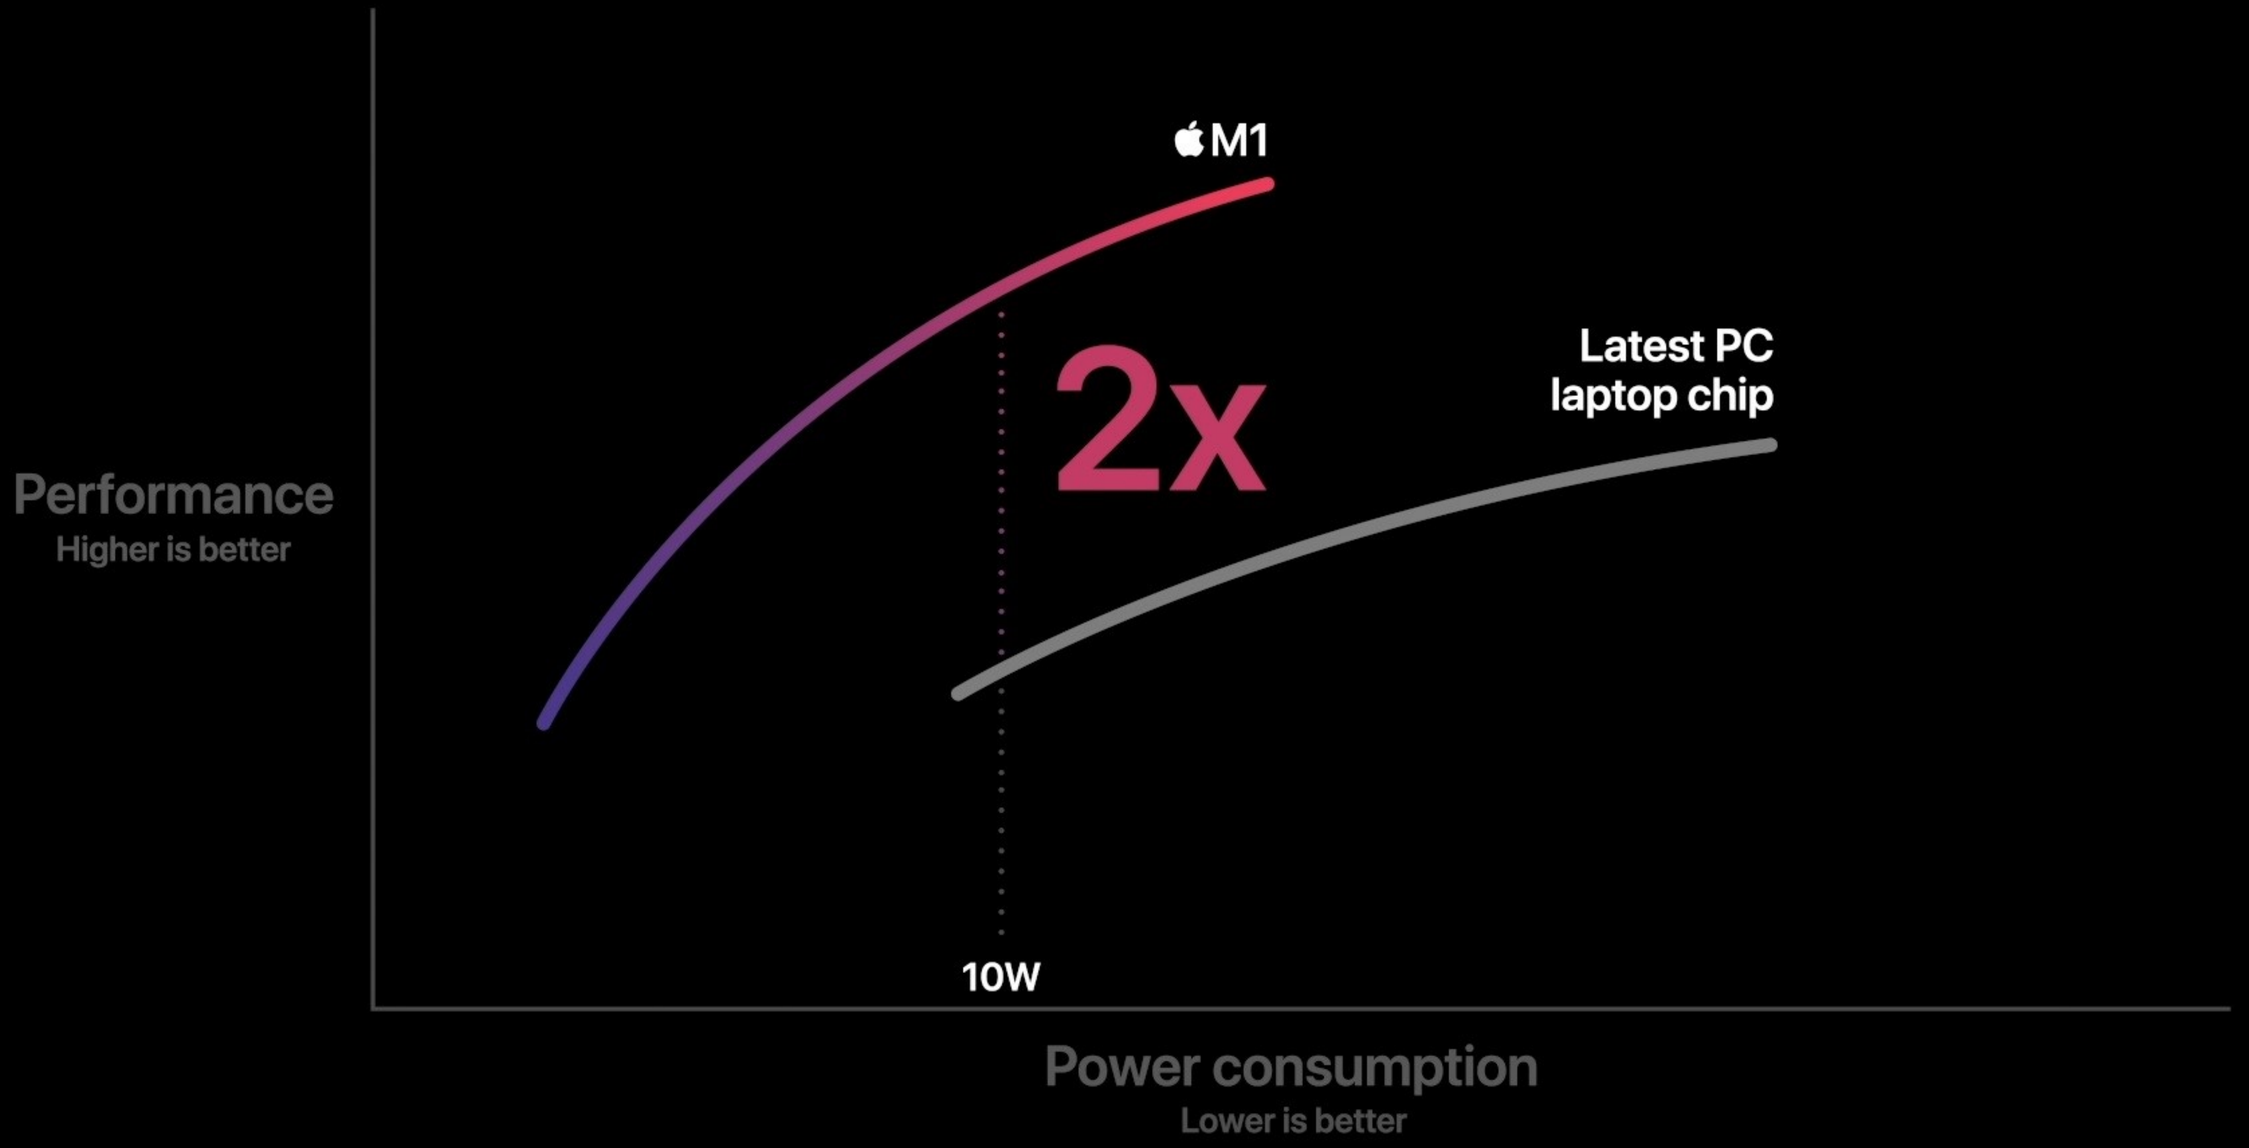
High bandwidth, low latency
Apple-designed package
Accessible to entire SoC

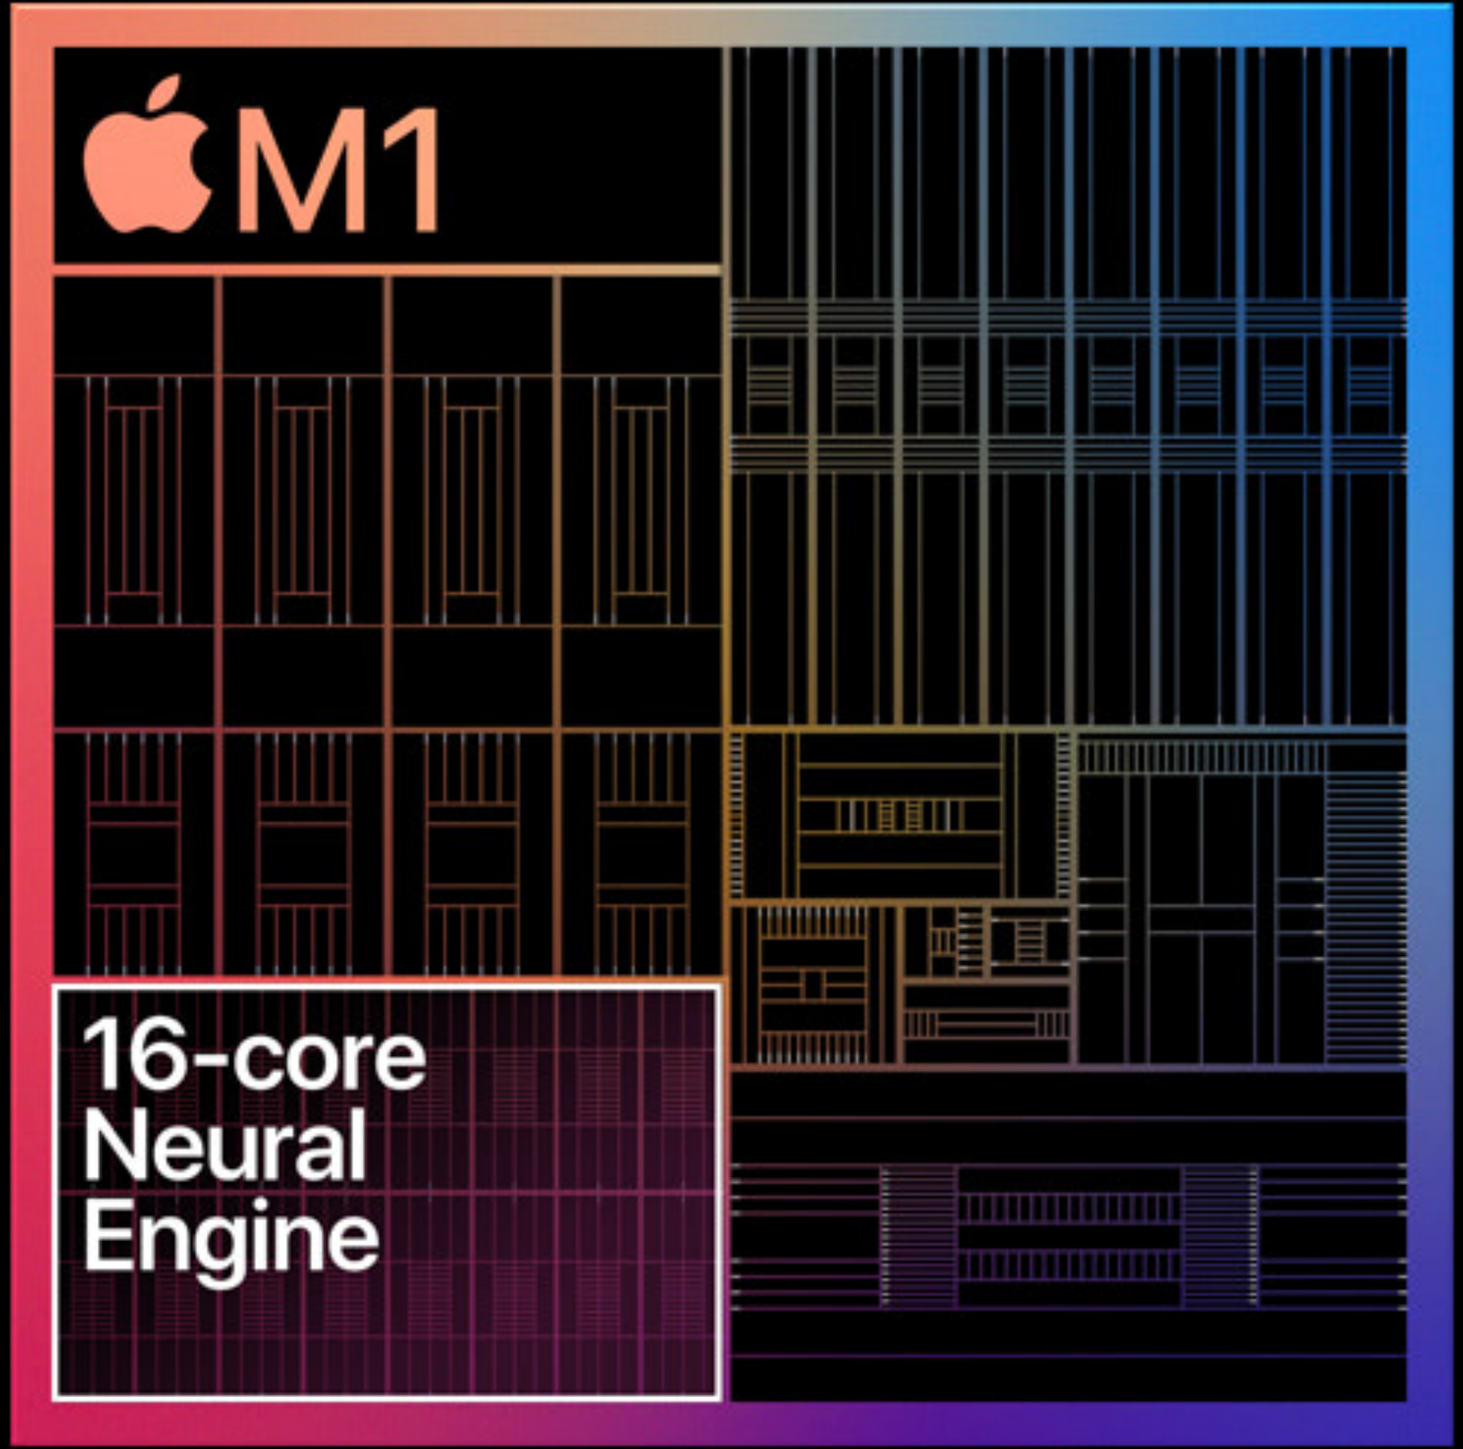
Benefits of UMA: All technologies in M1 SoC can access the same data without copying it between multiple pools of memory, improving performance & efficiency

CPU Performance vs. Power



GPU Performance vs. Power





M1
16-core
Neural
Engine

“The future of machine learning is at the ‘edge,’ which refers to the edge of computing networks, as opposed to centralized computing.

In a centralized machine learning network, users send data to a server, which makes a prediction, and sends that back to the user. This is slower, more expensive, less reliable, and less secure than edge computing, where predictions are made directly on the user’s device.” —Frederik Bussler

“…capable of 11 trillion operations per second, the Neural Engine in M1 enables up to 15x faster machine learning performance. In fact, the entire M1 chip is designed to excel at machine learning, with ML accelerators in the CPU and a powerful GPU, so tasks like video analysis, voice recognition, and image processing will have a level of performance never seen before on the Mac.” —Apple, November 10, 2020

What does the Neural Engine do?

“Final Cut Pro can intelligently frame a clip in a fraction of the time. Pixelmator Pro can magically increase sharpness and detail at incredible speeds.” —Apple

The Neural Engine can be used for: video analysis • voice & facial recognition • artificial intelligence • *computational photography* • recognizing objects in photos • identifying purposes of words in sentences for dictation • create captions on the fly for videos • *Night mode* to capture photos in low-light environments • augmented reality • *deep fusion*: snap a picture & the best pixels from 8 bursts are combined into 1 image • sleep tracking • translation • identify background sounds • handwriting recognition • *palm rejection* for Apple Pencil • virtual assistant response voices

Faster than 98%
of PC laptops

Let’s see what happens when you try to open 18 default apps on an M1 MacBook Air…

Johny Srouji, Senior Vice President, Hardware Technologies

Reviewers

“The M1 chips make laptops as powerful as some of the fastest desktops on the market yet so efficient that their battery life beats that of just about any other laptop. …

The result is something like the difference between a muscle car and a Tesla. The muscle car achieves high speeds with a huge engine that burns a lot of gasoline. The Tesla can hit even higher speeds while consuming less power because its electric motor is inherently more efficient than a gas engine. For years, Intel was making muscle cars; Apple’s big innovation was to build the Tesla of computer chips.” —Farhad Manjoo, *The New York Times*

“I’ll just cut to the chase — for content creation and creative work*, these are the most powerful laptops we’ve ever seen.” —Monica Chin, The Verge

* But not really for gaming, as she makes clear

“But … when I tell you these laptops are next level, I mean that because the real world performance and the real world capabilities of these laptops is dramatically better than they have any business doing. … I haven’t been able to say something’s truly next level in a really long time, but these are. It’s one of my favorite products of the year, to be honest.” —Marques Brownlee

“We expected large performance jumps, but we didn’t expect the [*sic*] some of the monstrous increases that the new chips are able to achieve. … [T]he M1 Pro & Max … achieve performance figures that simply weren’t even considered possible in a laptop chip. The chips here aren’t only able to outclass any competitor laptop design, but also competes against the best desktop systems out there, you’d have to bring out server-class hardware to get ahead of the M1 Max — it’s just generally absurd. (con't.)

“What’s clearer, is that the new GPU does allow immense leaps in performance for content creation and productivity workloads which rely on GPU acceleration. … The combination of raw performance, unique acceleration, as well as sheer power efficiency, is something that you just cannot find in any other platform right now, likely making the new MacBook Pro’s not just the best laptops, but outright the very best devices for the task.” —AnandTech

“The 16-inch MacBook Pro with the M1 Pro is the longest lasting laptop I’ve ever tested in my career as a hardware reviewer, like period. I got 16 hours of continuous use with the 16-inch M1 Pro model. I was jumping between a dozen-ish Chrome tabs, using a couple apps like Slack and Spotify, and often running Zoom calls and YouTube videos over that and I have never seen a laptop last this long.” —Monica Chin, The Verge

Getting More From Your Mac

History

R. Scott Granneman & Jans Carton

Changelog

2023-10-06 2.5: Updated name of new macOS to Sonoma; added image comparing modern macOS app icon to original Macintosh screen resolution; added visionOS to list

2022-07-22 2.4: Added info re Tech Specs

2022-03-08 2.3: Added new sections on *Apple's CPU History*, *M1*, & *M1 Pro & M1 Max*

Changelog

2021-06-07 2.2: Updated name of new macOS 12 Monterey

2021-06-05 2.1: Fixed minor formatting errors

2021-03-31 2.0: Created presentation using slides from the original Getting More From Your Mac & Granneman 1.7

Changelog

2021-03-23 1.8: Added how to copy & move files in Finder with key commands; added *Installing Software* section

2020-06-23 1.7: Added section *Get Info, Get Summary Info, & Show Inspector*; add info re: macOS 11 Big Sur; added slide listing all Apple operating systems

2019-08-16 1.6: Added Catalina for 10.15; added note that --- is not an em dash

Changelog

2017-09-20 1.5: Combined naming charts in *History*; fixed minor formatting issues; added Thank You, Scott (⌘⇧/) to *Basic Key Commands*; added Terminal commands for disclosure buttons; added Show the Finder location of a file from a dialog box; added screenshot of Finder sidebar; added command for QuickLook slideshow; added Special Info in Finder; updated Mac prices for 2019; fixed QuickLook slides

Changelog

2018-08-19 1.4: Added *File Info & Actions* section under Finder with Contextual Menus, Get Info, & Inspector; added HoudahSpot under Spotlight; added commands to open all disclosure boxes & Show Details for printing; added *File Management* section with New Folder with Selection; applied Granneman 1.4 theme; fixed minor formatting issues; added Sidebar under Components; more info on built-in security; added ⌘^D in addition to triple-click for data detectors

Changelog

2017-09-06 1.3: Fixed formatting; in *History* & added High Sierra; in *Key Commands*, added Alfred for clipboard; added slides re: holding down ⌥ in *Open & Save*; made deleting clearer in *Movement*; added slide about drop shadows in screenshots; added huge amount about Path Finder; added slides re: Finder renaming files; added lots of examples of Spotlight searches (RIP David Bowie); added New File Menu; added `duration:`, `date:`, & much more to Spotlight

Changelog

2016-10-11 1.2: Changed Lazy is Good image; spread Automation throughout the deck; renamed *Things You're Not Doing Right* to *Finder* & added lots more; added *Spotlight* section; changed *menulets* to *status menus*; added *Quick Look*

2016-10-07 1.1: Changed theme; fixed formatting; added & changed a lot; new stuff on Finder, Printing, Key Commands, System Preferences, Tabs; added *Computer Rules* section; lots of fixes

2016-03-13 1.0: First version

Licensing of this work
