You need Akismet if you're going to allow comments on your WordPress site

...but allowing comments do it

...but allowing comments is a really bad idea, so don't

Description

Akismet checks your comments and contact form submissions against our global database of spam to prevent your site from publishing malicious content. You can review the comment spam it catches on your blog's "Comments" admin screen.

Major features in Akismet include:

- Automatically checks all comments and filters out the ones that look like spam.
- Each comment has a status history, so you can easily see which comments were caught or cleared by Akismet and which were spammed

Does Akismet only work with WordPress?

While Akismet is most used on the WordPress platform it is not just for WordPress. We support a variety of other platforms such as Drupal, phpBB3, Joomla, and more.

To see a list of all platforms we support – the ones we know about at least – please visit the development page.

Passwords Evolved

Description

The goal of this plugin is to shore up the WordPress authentication using standard security practice recommendations. At this time, the plugin improves WordPress authentication by doing the following:

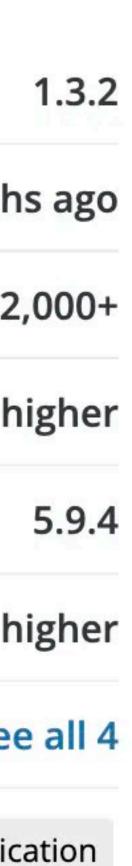

ENFORCING UNCOMPROMISED PASSWORDS

This plugin prevents someone from using passwords that have appeared in data breaches. Whenever someone logs into a WordPress site, it'll verify their password using the <u>Have I been pwned? API</u>. If their password appeared in a data breach, the plugin will prevent them from logging in until thou rosat thair password

Oh no — pwned!

Pwned in 10 data breaches and found no pastes (subscribe to search sensitive breaches)

Breaches you were pwned in

A "breach" is an incident where data has been unintentionally exposed to the public. Using the <u>1Password password manager</u> helps you ensure all your passwords are strong and unique such that a breach of one service doesn't put your other services at risk.

Å POLLO

Apollo: In July 2018, the sales engagement startup <u>Apollo left a database containing billions of data points</u> publicly exposed without a password. The data was discovered by security researcher <u>Vinny Troia</u> who subsequently sent a subset of the data containing 126 million unique email addresses to Have I Been Pwned. The data left exposed by Apollo was used in their "revenue acceleration platform" and included personal information such as names and email addresses as well as professional information including places of employment, the roles people hold and where they're located. Apollo stressed that the exposed data did not include sensitive information such as passwords, social security numbers or financial data. The Apollo website has a contact form for those looking to get in touch with the organisation.

Compromised data: Email addresses, Er Salutations, Social media profiles

Compromised data: Email addresses, Employers, Geographic locations, Job titles, Names, Phone numbers,

B2B USA Businesses: In mid-2017, a spam list of over 105 million individuals in corporate America was discovered online. Referred to as "B2B USA Businesses", the list categorised email addresses by employer, providing information on individuals' job titles plus their work phone numbers and physical addresses. <u>Read</u> more about spam lists in HIBP.

Compromised data: Email addresses, Employers, Job titles, Names, Phone numbers, Physical addresses

Data Enrichment Exposure From PDL Customer: In October 2019, security researchers Vinny Troia and Bob Diachenko identified an unprotected Elasticsearch server holding 1.2 billion records of personal data. The exposed data included an index indicating it was sourced from data enrichment company People Data Labs (PDL) and contained 622 million unique email addresses. The server was not owned by PDL and it's believed a customer failed to properly secure the database. Exposed information included email addresses, phone numbers, social media profiles and job history data.

Compromised data: Email addresses, Employers, Geographic locations, Job titles, Names, Phone numbers, Social media profiles

Evite: In April 2019, the social planning website for managing online invitations Evite identified a data breach of their systems. Upon investigation, they found unauthorised access to a database archive dating back to 2013. The exposed data included a total of 101 million unique email addresses, most belonging to recipients of invitations. Members of the service also had names, phone numbers, physical addresses, dates of birth, genders and passwords stored in plain text exposed. The data was provided to HIBP by a source who requested it be attributed to "JimScott.Sec@protonmail.com".

Compromised data: Dates of birth, Email addresses, Genders, Names, Passwords, Phone numbers, Physical addresses

EXACT^{SS}

Exactis: In June 2018, the marketing firm Exactis inadvertently publicly leaked 340 million records of personal data. Security researcher Vinny Troia of Night Lion Security discovered the leak contained multiple terabytes of personal information spread across hundreds of separate fields including addresses, phone numbers, family structures and extensive profiling data. The data was collected as part of Exactis' service as a "compiler and aggregator of premium business & consumer data" which they then sell for profiling and marketing purposes. A small subset of the exposed fields were provided to Have I Been Pwned and contained 132 million unique email addresses.

Compromised data: Credit status information, Dates of birth, Education levels, Email addresses, Ethnicities, Family structure, Financial investments, Genders, Home ownership statuses, Income levels, IP addresses, Marital statuses, Names, Net worths, Occupations, Personal interests, Phone numbers, Physical addresses, Religions, Spoken languages

factual

Factual: In March 2017, a file containing 8M rows of data allegedly sourced from data aggregator Factual was compiled and later exchanged on the premise it was a "breach". The data contained 2.5M unique email addresses alongside business names, addresses and phone numbers. After consultation with Factual, they advised the data was "publicly available information about businesses and other points of interest that Factual makes available on its website and to customers".

Compromised data: Email addresses, Employers, Phone numbers, Physical addresses

Geekedin: In August 2016, the technology recruitment site GeekedIn left a MongoDB database exposed and over 8M records were extracted by an unknown third party. The breached data was originally scraped from GitHub in violation of their terms of use and contained information exposed in public profiles, including over 1 million members' email addresses. Full details on the incident (including how impacted members can see their leaked data) are covered in the blog post on 8 million GitHub profiles were leaked from GeekedIn's MongoDB - here's how to see yours.

LinkedIn Scraped Data: During the first half of 2021, LinkedIn was targeted by attackers who scraped data from hundreds of millions of public profiles and later sold them online. Whilst the scraping did not constitute a data breach nor did it access any personal data not intended to be publicly accessible, the data was still monetised and later broadly circulated in hacking circles. The scraped data contains approximately 400M records with 125M unique email addresses, as well as names, geographic locations, genders and job titles. LinkedIn specifically addresses the incident in their post on An update on report of scraped data.

Compromised data: Education levels, Email addresses, Genders, Geographic locations, Job titles, Names, Social media profiles

Onliner Spambot: In August 2017, a spambot by the name of Onliner Spambot was identified by security researcher Benkow moyu3q. The malicious software contained a server-based component located on an IP address in the Netherlands which exposed a large number of files containing personal information. In total, there were 711 million unique email addresses, many of which were also accompanied by corresponding passwords. A full write-up on what data was found is in the blog post titled Inside the Massive 711 Million Record Onliner Spambot Dump.

Compromised data: Email addresses, Passwords

Verifications.io: In February 2019, the email address validation service verifications.io suffered a data breach. Discovered by Bob Diachenko and Vinny Troia, the breach was due to the data being stored in a MongoDB instance left publicly facing without a password and resulted in 763 million unique email addresses being exposed. Many records within the data also included additional personal attributes such as names, phone numbers, IP addresses, dates of birth and genders. No passwords were included in the data. The Verifications.io website went offline during the disclosure process, although an archived copy remains viewable.

Compromised data: Dates of birth, Email addresses, Employers, Genders, Geographic locations, IP addresses, Job titles, Names, Phone numbers, Physical addresses

Recently added breaches

In the last month, there were 1,260,000,000 occasions where a service somewhere checked a password against Have I Been Pwned's (HIBP's) Pwned Password API. 99.7% of the time, that check went no further than one of hundreds of Cloudflare edge nodes spread around the world (95% of the world's population is within 50ms of one). It looks like this:

Today, I'm really excited to mark a major milestone in the project thanks to the support of two of the world's foremost law enforcement agencies, the FBI and the NCA.

Last year I wrote about my intention to begin open sourcing parts of HIBP. I'm only able to run this project due to support from the community, so I wanted to start giving it back to the public in a bid to make it more open, more sustainable and in turn, more valuable to every single one of you using it. I made the decision to begin with Pwned Passwords and in May, I transitioned it into the .NET Foundation and announced we'd be building an ingestion pipeline. This pipeline enables the ingestion of passwords from law enforcement agencies, like the FBI. The premise is simple: during the course of their investigations, they come across a lot of compromised passwords and if they were able to continuously feed those into HIBP, all the other services out there using Pwned Passwords would be able to better protect their customers from account takeover attacks.

Wait so are you sending my password to a 3rd party!?

No, the plugin never sends your full password to a 3rd party for verification. The plugin only sends the first five characters of the <u>SHA-1</u> hashed password to a 3rd party. The 3rd party then sends back all passwords with a hash that starts with those five characters.

The plugin then handles the rest of the password validation itself. It compares the SHA-1 hashed version of your password to the passwords returned by the 3rd party. We call this process <u>k-anonymity</u>. (You can read more about validating leaked passwords with it <u>here</u>.)

Passwords Evolved

"Have I been pwned?" API

Passwords Evolved uses the "Have I been pwned?" API to determine if someone is using a compromised password or not. You can read more about the API here. You can find the status of the API below.

You can also find all the roles used on your WordPress site. For each role, you can toggle password enforcement on login. If password enforcement is enabled for a role, someone with a compromised password won't be able to log in until they reset their password with an uncompromised one.

The plugin also encrypts passwords using either the <u>bcrypt</u> and <u>Argon2</u> hashing functions. These are the strongest hashing functions available in PHP. Argon2 is available natively starting with PHP 7.2, but the plugin can also encrypt passwords on older PHP versions using the <u>libsodium</u> compatibility layer introduced in WordPress 5.2.

WP 2FA – Two-factor authentication for WordPress

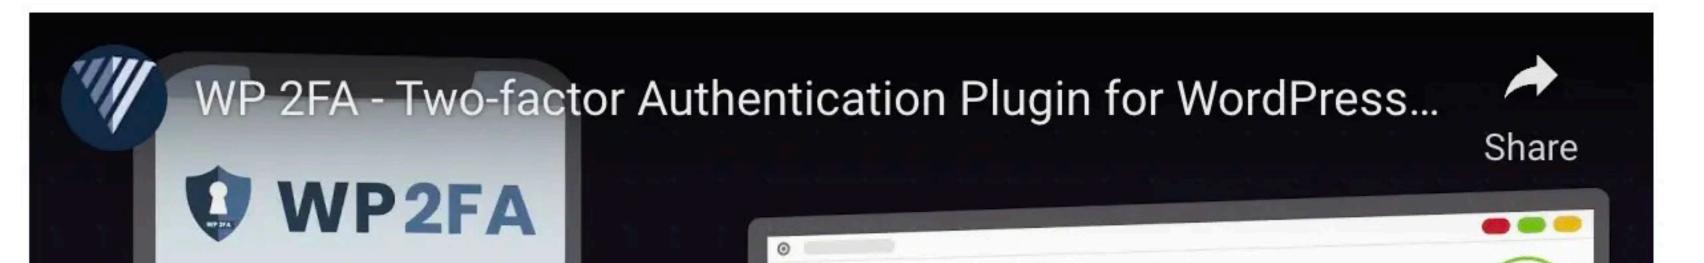

By WP White Security

Description

A FREE & EASY TO USE TWO-FACTOR AUTHENTICATION PLUGIN FOR WORDPRESS

Add an extra layer of security to your WordPress website login page and its users. Enable two-factor authentication (2FA), the best protection against users using weak passwords, and automated password guessing and brute force attacks.

WP 2FA KEY PLUGIN FEATURES & CAPABILITIES

- Free Two-factor authentication (2FA) for all users
- Supports <u>multiple 2FA methods</u>
- Universal 2FA app support generate codes from Google Authenticator, Authy & any other 2FA app
- Supports <u>2FA backup methods</u>
- Very easy to use and simple to set up
- Use <u>2FA policies to enforce 2FA with a grace period</u>
- Or require users users to instantly setup 2FA upon logging in
- Out of the box support for third party plugins such as WooCommerce and other e-commerce & membership plugins
- No WordPress dashboard access required for users to set up 2FA
- Protection against automated password & dictionary attacks
- And many other <u>plugin features</u>)

Works with any 2FA app

Your website users do not have to install and learn how to use a new 2FA app. WP 2FA works with all the popular 2FA smartphone apps, including Authy, Google Authenticator, Microsoft Authenticator, Lastpass, FreeOTP and many others. With an easy-touse wizard and support for all 2FA apps, your users can configure and use 2FA without requiring any help, within just seconds.

The world's most-loved password manager

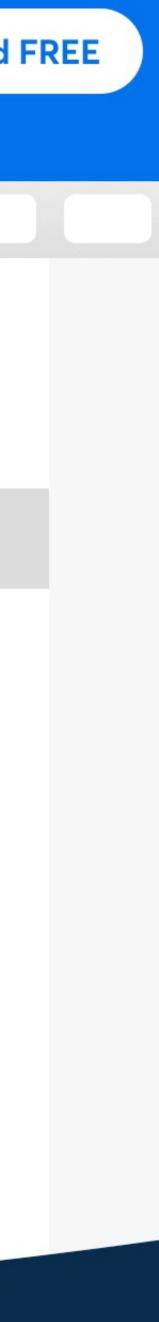

1Password is the easiest way to store and use strong passwords. Log in to sites and fill forms securely with a single click.

Welcome to WP 2FA

Choose Method

You are required to configure 2FA.

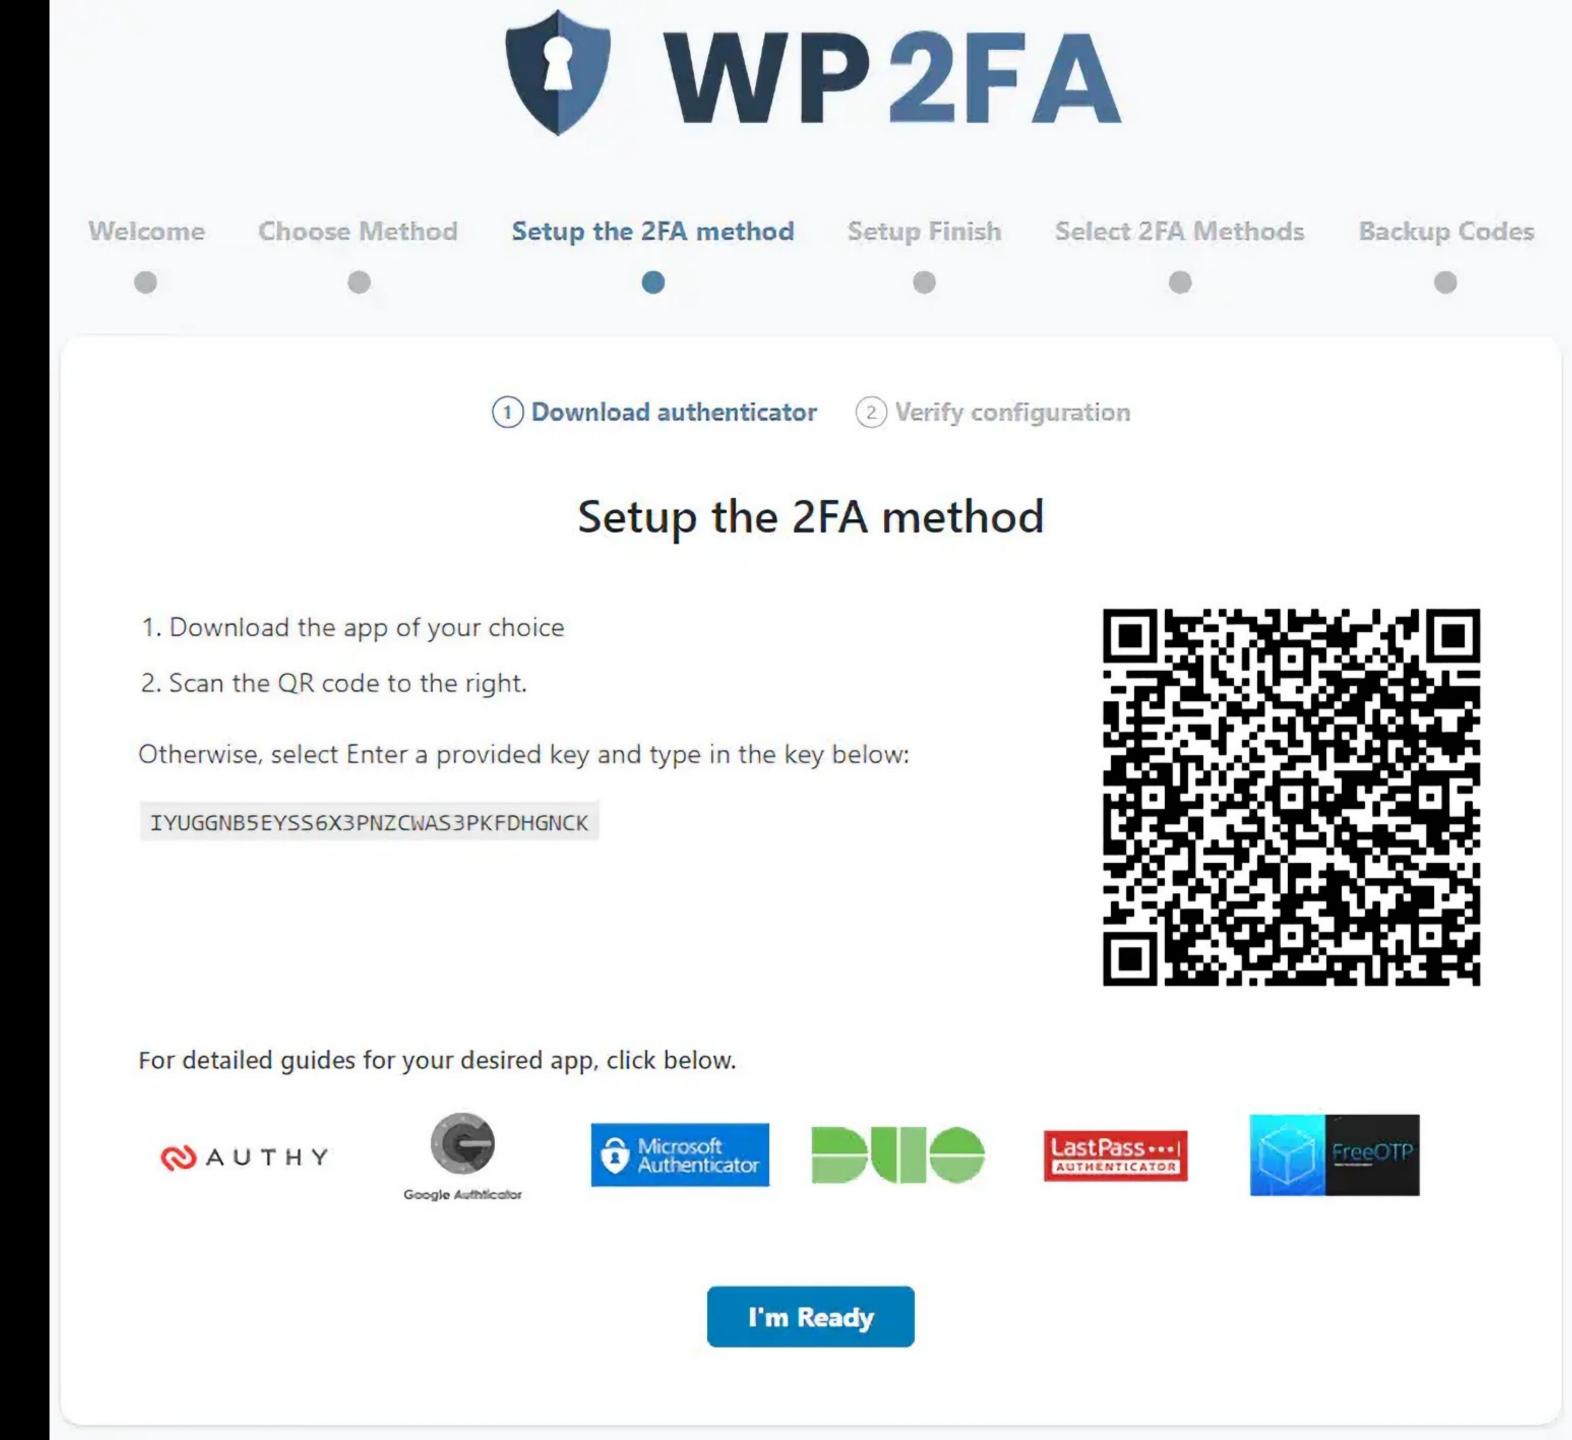

In order to keep this site - and your details secure, this website's administrator requires you to enable 2FA authentication to continue.

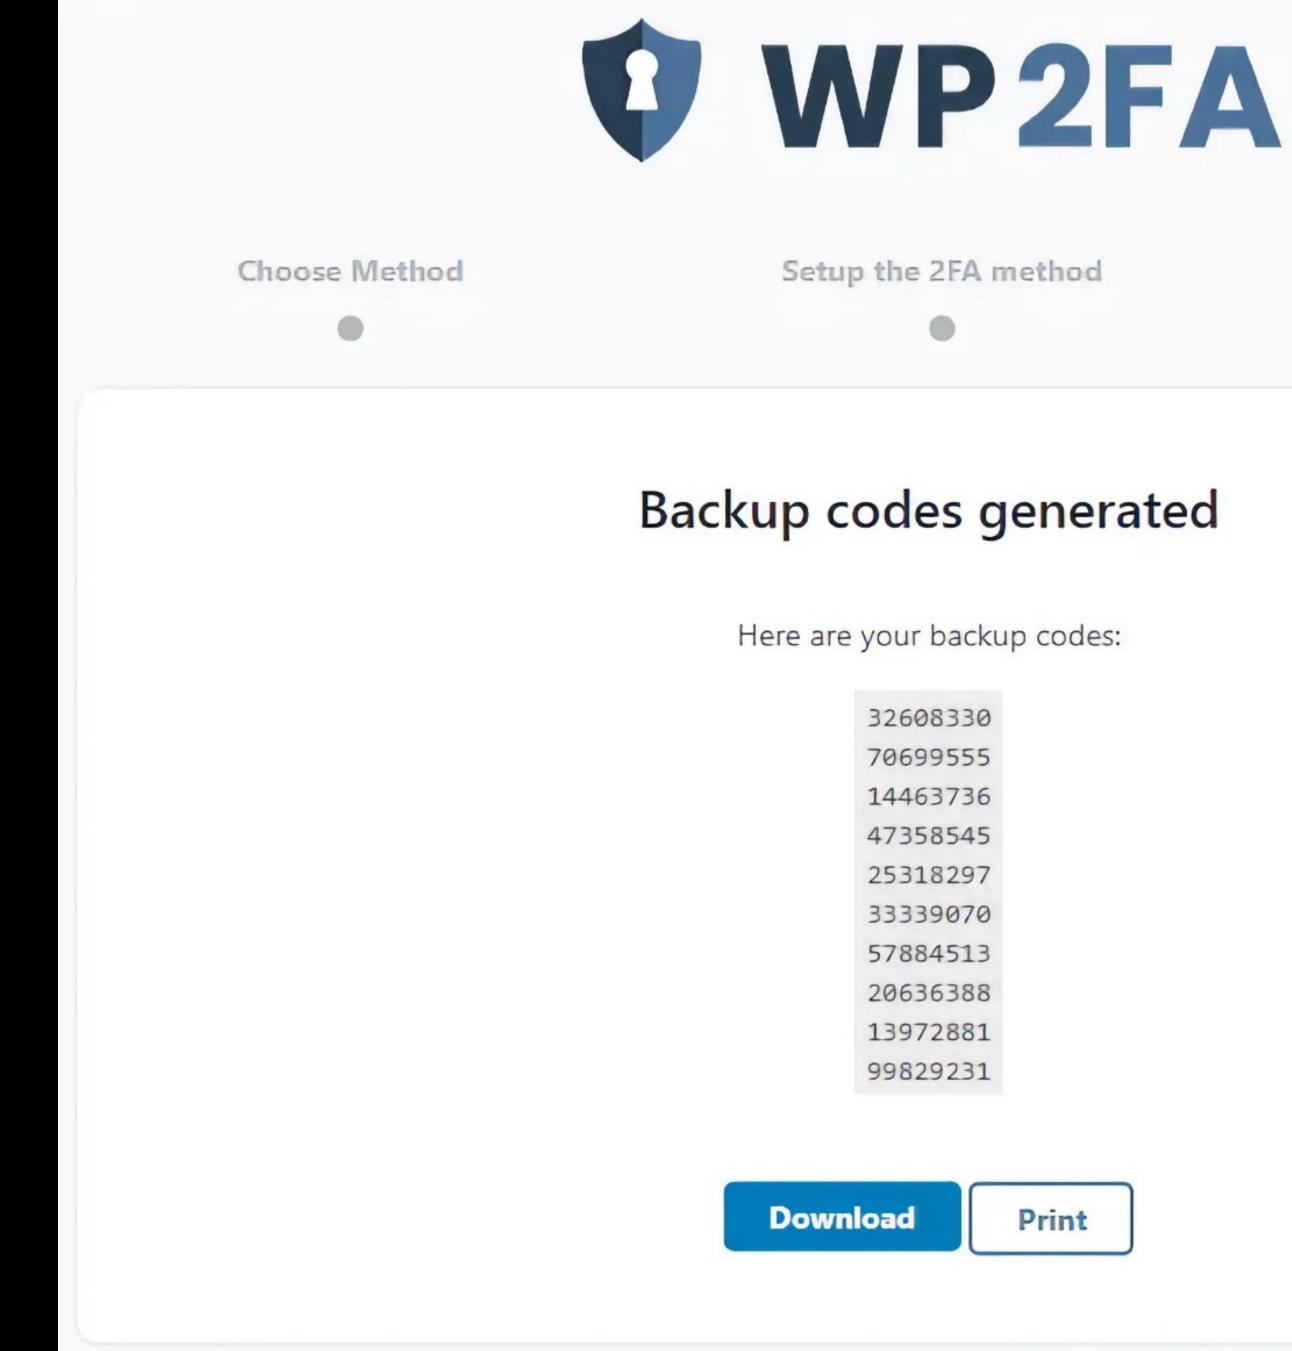

Two factor authentication ensures only you have access to your account by creating an added layer of security when logging in - Learn more

Setup the 2FA method

Backup Codes

Backup Codes

I'm ready

Settings

Which of the below 2FA methods can users use?

Select the methods

Primary 2FA methods:

One-time code via 2FA App (TOTP) - <u>complete list of supported 2FA apps.</u>

Allow user to specify the email address of choice

🔘 Yes 💽 No

Secondary 2FA methods:

Backup codes - Backup codes are a secondary method which you can use to log in to the website in case the primary 2FA method is unavailable. Therefore they can't be enabled and used as a primary method.

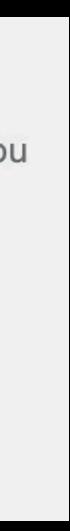

Do you want to enforce 2FA for some, or all the users?

When you enforce 2FA the users will be prompted to configure 2FA the next time they login. Users have a grace period for configuring 2FA. You can configure the grace period and also exclude user(s) or role(s) in this settings page. Learn more.

Enforce 2FA on	 All users
	Only for specific users an
	O not enforce on any use

nd roles

ers

Should users be asked to setup 2FA instantly or should they have a grace period?

When you enforce 2FA on users they have a grace period to configure 2FA. If they fail to configure it within the configured stipulated time, their account will be locked and have to be unlocked manually. Note that user accounts cannot be unlocked automatically, even if you change the settings. As a security precaution they always have to be unlocked them manually. Maximum grace period is 10 days. Learn more.

Grace period

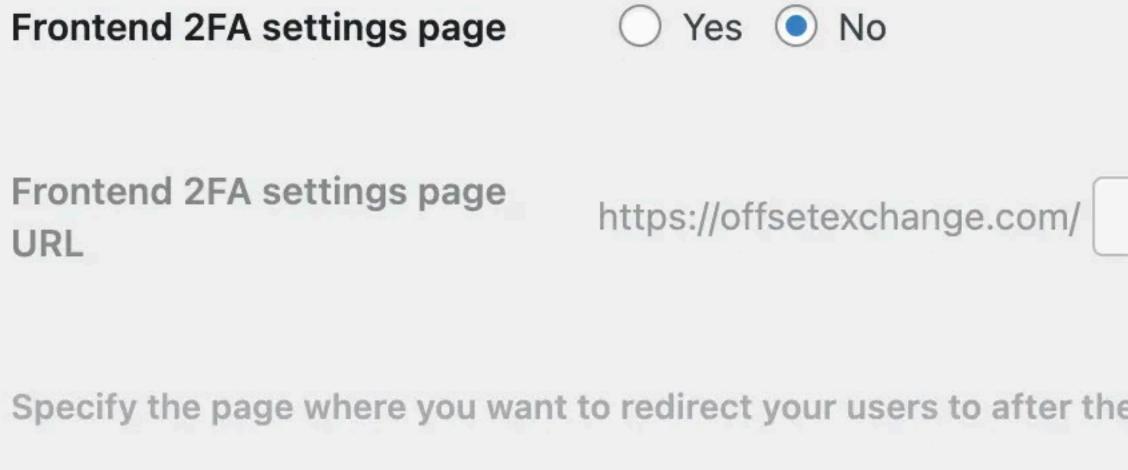

Users have to configure 2FA straight away.

Give users a grace period to configure 2FA

Can users access the WordPress dashboard or you have custom profile pages?

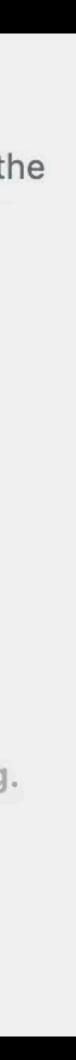

If your users do not have access to the WordPress dashboard (because you use custom user profile pages) enable this option. Once enabled, the plugin creates a page which ONLY authenticated users can access to configure their user 2FA settings. A link to this page is sent in the 2FA welcome email.

Redirect	users	after	2FA
setup			

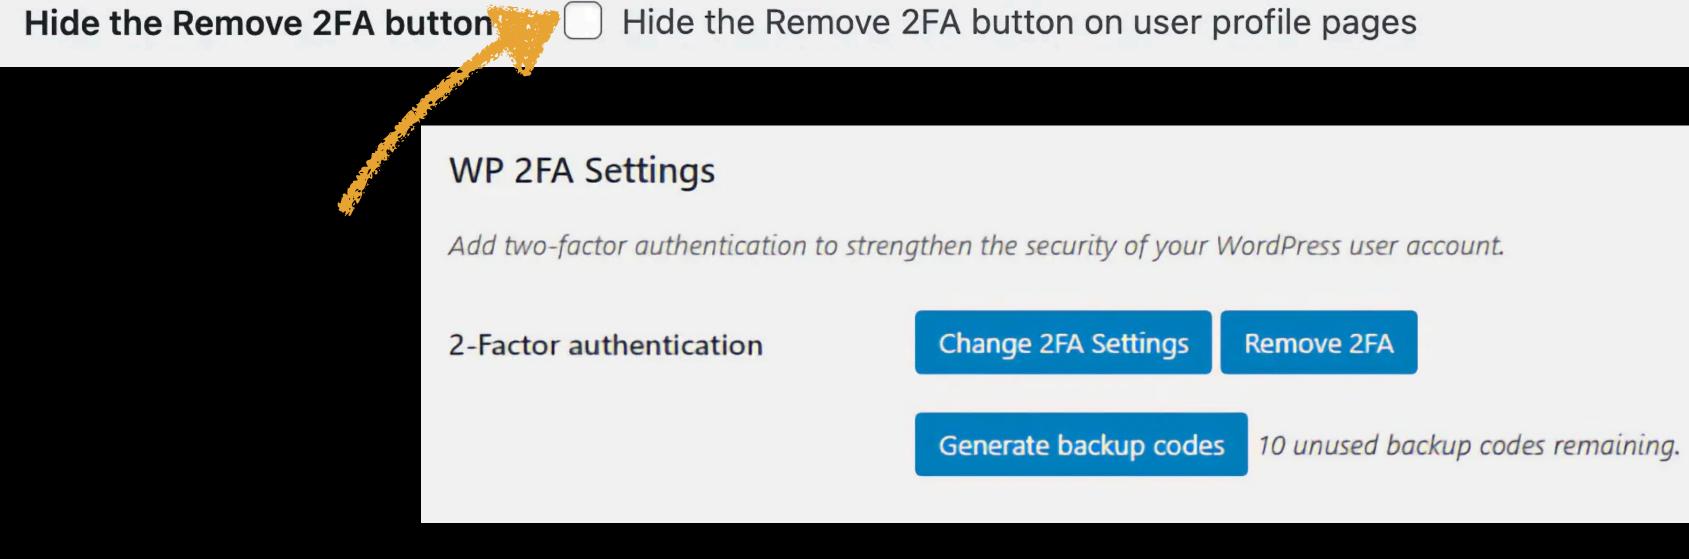

https://offsetexchange.com/

Specify the page where you want to redirect your users to after they complete the 2FA setup. This will override the global redirect setting.

Should users be able to disable 2FA on their user profile?

Users can configure and also disable 2FA on their profile by clicking the "Remove 2FA" button. Enable this setting to disable the Remove 2FA button so users cannot disable 2FA from their user profile.

Should users be able to disable 2FA on their user profile?

Is ManageWP secure?

Yes. All of our code is developed in-house and we have a top notch security team. With half a million websites managed since 2012 we did not have a single security incident. We've accomplished this through high standards, vigilance and the help of security researchers, through our white hat security program.

^

Thank you!
